Why would you want to film in 3D?

Well, directors such as Steven Spielberg, James Cameron, and various others have been using 3D for decades. This software is compatible with PCs only, and not with the Mac or Linux OS. If you have ever considered filming in 3D yourself, you may have been frustrated by the lack of options. However, Tachyon has now introduced a revolutionary new 3D system that can take your videos into a new dimension.

Some idea on what you will be able to do with the Tachyon XC system.

Videos taken with your Tachyon XC are in VGA resolution (4:3 Aspect ratio). This will play back on any computer. Be sure to use a fast SDHC card. A class 6 card is recommended. Faster cards will allow for more extended recording times.

When you receive your Tachyon XC, you must insert a SDHC card first. The first time you turn your Tachyon XC on, it will detect that a card has been inserted, and will automatically begin recording video. Please note that it will begin recording your video as soon as you turn your device on. If your question is not answered there, please feel free to contact our staff us at support@tachyoninc.com.

Technically, the XC integrates two Tachyon XC cameras, a 3D mount, a frame, motors, and RAM. There is no need for you to set the clock or calendar before using your camera. But if you want to do so, hold down the START/STOP button and press the MENU button. This will display either ON or OFF on the LCD. Press the START/STOP button and select D or E. This will change the flashing NTSC to a flashing PAL.

To begin taking videos, hold down the START/STOP Button for two seconds. If you remove your batteries for more than a few minutes, your time and date settings will be lost. Once you see the low battery indicator, we suggest that you press the START/STOP Button again to stop and the LED will turn green.

Remember: You will have to use a class 6 SDHC card. They are now a reasonable price and will give you many hours of video storage. Although the TACHYON XC is designed to handle extreme situations, it would be best not to leave it sitting in strong sunlight for extended periods of time. Although it is waterproof, you should not leave it in a rainstorm for long periods of time.

To exit the menu, press and hold the START/STOP Button you will hear a beep sound and begin to capture a picture. Please note that it will begin recording your video as soon as you turn your device on. If you do leave the back door open, it is probably a sign that you need to change your batteries. To do this, hold down the START/STOP Button until you hear a beep sound and the numbers on the LCD begin to advance. Press the START/STOP Button again to stop and the LED will turn green. This will begin recording again automatically after 5 seconds. You will not need to do anything. Although the TACHYON XC is designed to handle extreme situations, it would be best not to leave it sitting in strong sunlight for extended periods of time.
