</table>
Repeaters are often installed and maintained by radio clubs, sometimes with the cooperation of local businesses involved in the communications industry.

Compared to simplex communication, you can usually transmit over much greater distances by using a repeater. Repeaters are typically located on mountain tops or other elevated locations. They generally operate at higher ERP (Effective Radiated Power) than a typical station. This combination of elevation and high ERP allows communications over considerable distances.

### REPEATER ACCESS

Most repeaters use a receive and transmit frequency pair with a standard or non-standard offset (odd-split). In addition, some repeaters must receive a tone from the transceiver in order to gain access to the repeater. For details, consult your local repeater reference.

#### Selecting an Offset Direction

The offset direction allows your transmit frequency to be higher (+) or lower (–) than the receive frequency.

1. Select your desired band (A or B).
2. Press [F], [SHIFT] to select an offset direction.
   - Each time you press [SHIFT], the offset direction changes as follows:
     - Simplex operation >> + >> – >> Simplex operation
   - If you are using an E type transceiver, when operating on the 430 MHz band, the offset direction changes as follows:
     - Simplex operation >> + >> – >> = (–7.6 MHz) >> Simplex operation

If the offset transmit frequency falls outside the allowable range, transmitting is inhibited. Use one of the following methods to bring the transmit frequency within the band limits:
- Move the receive frequency further inside the band.
- Change the offset direction.

#### Selecting an Offset Frequency

The offset frequency is the value which the transmit frequency will be offset from the receive frequency. The default offset frequency on the 144 MHz band is 600 kHz for all type versions. The default on the 430/440 MHz band is 5 MHz.

1. Select your desired band (A or B).
2. Enter Menu mode and access Menu 400.
3. Set the appropriate offset frequency value.
   - The selectable range is from 00.00 MHz to 29.95 MHz, in steps of 50 kHz.

**Note:** After changing the offset frequency, the new offset frequency will also be used by Automatic Repeater Offset.

#### Activating the Tone Function

To turn the Tone function on:

1. Select your desired band (A or B).
2. Press [TONE] to turn the Tone function ON.
   - Each time you press [TONE], the selection changes as follows:
     - Tone (■) --> CTCSS (■) --> DCS (■) --> Off (no display).
   - The ■ icon appears on the display when the tone function is ON.

**Note:** When accessing a repeater that requires a 1750 Hz tone, you do not need to activate the Tone function. Simply press the key assigned to the 1750 Hz tone (Menu 507 – 512) to transmit the tone.
Selecting a Tone Frequency

To select the tone frequency required to access your desired repeater:

1. Turn the Tone function ON.
2. Press [F], [T.SEL].
   • The current tone frequency appears on the display. The default frequency is 88.5 Hz.
3. Rotate the Tuning control to select your desired frequency.
   • To exit the tone frequency selection, press [ESC].
4. Press any key other than the Tuning control and [ESC] to set the selected frequency.

Note: If you have set up a Memory channel with a tone setting, simply recall the Memory channel instead of setting up the tone frequency every time.

Automatic Repeater Offset (K and E Types Only)

This function automatically selects an offset direction and activates the Tone function, according to the frequency that you have selected. To obtain an up-to-date band plan for repeater offset direction, contact your national Amateur Radio association.

1. Enter Menu mode and access Menu 401.
2. Set the ARO to ON.
4. Press [VFO] to select VFO mode.

TRANSMITTING A 1750 Hz TONE

Most repeaters in Europe require that a transceiver transmit a 1750 Hz tone. On a E type model, simply pressing Microphone [CALL] causes it to transmit a 1750 Hz tone. It is also possible to program [1750] on the front panel as a PF key for transmitting a 1750 Hz tone.

Note: The transceiver continuously transmits a 1750 Hz tone until you release Microphone [CALL] or PF key(1750).

Some repeaters in Europe must receive continuous signals for a certain period of time, following a 1750 Hz tone. This transceiver is also capable of remaining in the transmit mode for 2 seconds after transmitting a 1750 Hz tone.

1. Enter Menu mode and access Menu 402.
2. Set the tone to ON or OFF.
   • When set to ON, the 1750 Hz tone will transmit. When set to OFF, the tone will not be transmitted.

Note: While remaining in the transmit mode, the transceiver does not continuously transmit a 1750 Hz tone.
REVERSE FUNCTION

After setting a separate receive and transmit frequency, you can exchange these frequencies using the Reverse function. This allows you to manually check the strength of signals you receive directly from other stations, while using a repeater. If the station’s signal is strong, move to a simplex frequency to continue the contact and free up the repeater.

Press [REV] to turn the Reverse function ON or OFF.

- When the Reverse function is ON, the icon will appear on the display.

Pressing [PTT] will cause an error tone to sound and transmission will be inhibited.

Note:

- If the transmit frequency is outside the allowable transmit frequency range when using Reverse, pressing [PTT] will cause an error tone to sound and transmission will be inhibited.
- If the receive frequency is outside the receive frequency range when using Reverse, an error tone will sound and Reverse will not operate.
- The ARO (Automatic Repeater Offset) will not function when Reverse is ON.
- You cannot switch Reverse ON or OFF while transmitting.

AUTOMATIC SIMPLEX CHECKER (ASC)

While using a repeater, ASC periodically monitors the strength of signals you receive directly from the other stations. If the station’s signal is strong enough to allow direct contact without a repeater, the icon blinks.

Press [REV] (1s) to turn the ASC ON.

- When the ASC is ON, the icon will appear on the display.

Pressing [PTT] will cause the icon to stop blinking.

ASC does not function if you are using simplex operation.

ASC does not function while scanning.

Activating ASC while using Reverse will switch the Reverse function OFF.

If you recall a Memory channel or the Call channel, and those channels are set up with the Reverse function switched ON, the ASC will switch OFF.

You cannot use ASC when the built-in TNC is turned ON.

ASC causes received signals to be momentarily intermitted every 3 seconds.

TONE FREQUENCY ID

This function scans through all tone frequencies to identify the incoming tone frequency on a received signal. You can use this function to find which tone frequency is required by your local repeater.

1. Press [TONE] to switch the Tone function ON.
   - The icon appears on the display.

2. Press [F], [T.SEL] (1s) to run the Tone Frequency ID scan.
   - The icon blinks and SCAN appears on the display.

3. Press the Tuning control to program the identified frequency in place of the currently set tone frequency.
   - The Tone function will remain ON. You can press [TONE] to switch the Tone function OFF.
   - Press [ESC] if you do not want to program the identified frequency.

Note:

- Pressing [PTT] will cause the icon to stop blinking.
In Memory channels, you can store frequencies and related data that you often use. Then you need not reprogram the data every time. You can quickly recall a programmed channel by simple operation. A total of 1000 Memory channels are available for bands A and B.

SIMPLEX & REPEATER OR ODD-SPLIT MEMORY CHANNEL?

You can use each memory channel as a simplex & repeater channel or as an odd-split channel. Store only one frequency to use as a simplex & repeater channel or two separate frequencies to use as an odd-split channel. Select either application for each channel depending on the operations you have in mind.

Simplex & repeater channels allow:
- Simplex frequency operation
- Repeater operation with a standard offset (if an offset direction is stored)

Odd-split channels allow:
- Repeater operation with a non-standard offset

The data listed below can be stored in each Memory channel:

<table>

</table>

STORING SIMPLEX AND STANDARD REPEATER FREQUENCIES

1. Press [VFO] to enter VFO mode.
2. Rotate the Tuning control to select your desired frequency.
   - Additionally, you can press the microphone [UP]/[DWN] keys to select a frequency.
3. Set up any additional data desired for the frequency.
   - Offset direction, Tone ON/OFF, Tone frequency, CTCSS ON/OFF, CTCSS frequency, DCS ON/OFF, DCS code, etc.
4. Press [F].
   - A memory channel number appears.
5. Rotate the Tuning control to select your desired channel number.
   - Additionally, you can press the microphone [UP]/[DWN] keys to select a channel.
6. Press [M.IN] to store the data in the selected Memory channel.

Call Channel Memory (Simplex)

The Call channel can be used to store any frequency and related data that you will recall often. You may want to dedicate the Call channel as an emergency channel within your group.

To store a simplex frequency and related data as the Call channel instead of in a Memory channel, after step 4 (above), press [C.IN].

Note: Storing new data in the Call channel will clear the old data. (The Call channel itself cannot be cleared, but data can be replaced with new data.)
STORING ODD-SPLIT REPEATER FREQUENCIES

Some repeaters use a receive and transmit frequency pair with a non-standard offset. To access those repeaters, store two separate frequencies in a memory channel. You can then operate on those repeaters without changing the offset frequency you stored in the menu.

1. Set up a simplex channel by following steps 1 to 6 of "STORING SIMPLEX AND STANDARD REPEATER FREQUENCIES", above.

2. Press [VFO] to enter VFO mode.

3. Rotate the Tuning control to select your desired transmit frequency.
   - Additionally, you can press the microphone [UP]/[DWN] keys to select a frequency.

4. Set up any additional data desired for the transmit frequency.
   - Tone ON/OFF, Tone frequency, CTCSS ON/OFF, CTCSS frequency, DCS ON/OFF, DCS code, etc.

5. Press [F].
   - A memory channel number appears.

6. Rotate the Tuning control to select your desired channel number.
   - Additionally, you can press the microphone [UP]/[DWN] keys to select a channel.

7. Press [PTT], [M.IN] to store the data in the selected Memory channel.

Call Channel Memory (Odd-Split)

The Call channel can be used to store any frequency and related data that you will recall often. You may want to dedicate the Call channel as an emergency channel within your group.

To store an odd-split frequency and related data as the Call channel instead of in a Memory channel, after step 6 (above), press [PTT], [C.IN].

Note: You cannot store the transmit offset status and Reverse status in an odd-split Call channel.

RECALLING A MEMORY CHANNEL

1. Press [MR] to enter Memory Recall mode.

2. Rotate the Tuning control to select your desired Memory channel.
   - Additionally, you can press the microphone [UP]/[DWN] keys to select a channel, or you can enter a channel number using the microphone keypad.

Memory Recall Method

The transceiver Menu also provides you with the option to recall Memory channels with stored frequencies in your current band, or all Memory channels:

1. Enter Menu mode and access Menu 201.

   MEMORY RECALL METHOD
   CURRENT
   ALL BANDS

2. Set the recall method to CURRENT (current band) or ALL BANDS (all bands).
   - CURRENT allows you to recall only those memory channels that have stored frequencies within the current band. ALL allows you to recall all programmed memory channels.
   - When the recalled memory channel is an AM channel, you cannot recall on the B band.

Frequency ranges:
- 118 MHz: 118 ~ 135.995 MHz
- 144 MHz: 136 ~ 199.995 MHz
- 220 MHz: 200 ~ 299.995 MHz
- 300 MHz: 300 ~ 399.995 MHz
- 430/440 MHz: 400 ~ 523.995 MHz
- 1200 MHz: 800 ~ 1299.990 MHz

CLEARING A MEMORY CHANNEL

1. Press [MR] to enter Memory Recall mode.

2. Rotate the Tuning control to select your desired Memory channel.
   - Additionally, you can press the microphone [UP]/[DWN] keys to select a channel, or you can enter a channel number using the microphone keypad.

3. Turn the transceiver power OFF.

4. Press [MR] + Power ON.
   - A confirmation message appears on the display.

5. Press the Tuning control to clear the Memory channel.
   - To exit without clearing the channel, press [ESC].
NAMING A MEMORY CHANNEL

You can name Memory channels using up to 8 characters. When you recall a named Memory channel, its name appears on the display. Names can be call signs, repeater names, cities, people, etc.

1. Press [MR] to enter Memory Recall mode.
2. Rotate the Tuning control to select your desired Memory channel.
3. Enter Menu mode and access Menu 200.
4. Enter your desired name for the channel.

**Note:** You can overwrite a Memory channel name by performing the steps above. You can also clear a Memory channel name by clearing the Memory channel.

MEMORY-TO-VFO TRANSFER

Transferring the contents of a Memory channel or the Call channel to the VFO can be useful if you want to search for other stations or a clear frequency, near the selected Memory channel or Call channel frequency.

1. Press [MR] or [CALL] to enter Memory Recall mode or select the Call channel.
2. Rotate the Tuning control to select your desired channel. (This step is not necessary when selecting the Call channel.)
3. Press [F], [M>V].
   - The entire contents of the Memory channel or Call channel are copied to the VFO, and VFO mode is selected after the transfer is complete.
   - When copying a transmit frequency from an odd-split Memory or Call channel, you must first turn the Reverse function ON before pressing [F], [M>V].

CHANNEL DISPLAY FUNCTION

Use this function when you want to use only Memory channels. When this function is switched ON, the transceiver displays only a Memory channel number instead of a frequency.

1. Turn the transceiver power OFF.
2. Press [LOW] + Power ON to turn the channel display ON or OFF.

**Note:**
- If no Memory channels have saved data in them, channel display will not function.
- When using Channel Display, you cannot reset the transceiver.

While in Channel Display mode, the transceiver keys function as shown next page:
<table>

**MEMORY CH-4**
Programmable Memory (PM) stores virtually all settings currently set on the transceiver. This transceiver provides 5 PM channels to store 5 sets of transceiver configurations. Later, you can quickly recall any one of these channels, depending on the operations you have in mind or the operating environment.

The following programmable settings cannot be stored:

- Memory name
- Memory channel lockout
- Channel Display mode
- Locked-band/ Cross-band Repeater ON/OFF
- Repeater mode
- Repeater hold
- Repeater ID transmit
- Registered repeater ID
- Wireless remote control
- Answer back
- Remote control ID
- Key lock
- Power on password
- Memory channel/ Call channel/ Program scan memory
- Weather channel
- DTMF memory
- EchoLink memory
- COM port speed
- PC port speed
- 10 MHz mode
- Mic sensitivity
- SQC data output logic

1 K type only
2 Can be set only by using the MCP-2A software.

APPLICATION EXAMPLES

The following are examples of how you might use Programmable Memory. These examples may not represent applications useful to you, but you will understand the flexibility of this function.

**Situation:** You share your transceiver with other members in your family or club. However, each individual has personal preferences for how they like to set various functions. You have to keep changing many settings each time you use the transceiver.

**Solution:** Because 5 PM channels are available, up to 5 persons can separately program the transceiver and store their customized environment. Then each person can quickly change to his or her favorite settings, simply by recalling a PM channel. It is too much trouble to change back the settings after somebody else has reconfigured them. So this application may avoid having a feature-rich transceiver but never using many useful features.

**Situation:** While operating mobile on the way to work every morning, you prefer a silent transceiver that does not interrupt the morning calm. In addition, you feel that a bright display is useless in the sunlight. At night when driving home, you realize the Beep function truly does serve a purpose and you acknowledge it is nice to see a bright display after dark.

**Solution:** In 2 PM channels, store the same operating data such as frequency, offset, tone, etc, and store different settings for the Display brightness and Beep functions. Then you can quickly recall the best settings for day or night operation.

**Situation:** You cannot figure out how to exit the current transceiver mode.

**Solution:** Simply recall PM channel 1, which contains an exact copy of the transceiver default environment. You will not lose the contents of any memory channels.
STORING DATA IN PM CHANNELS

1. Confirm that the following conditions have been satisfied:
   • The transceiver is in receive mode.
   • Scan is not being used.
   • Microphone Control is OFF.

2. Configure the transceiver with your desired settings.

3. Press [F], [P.IN].
   • PM channel numbers 1 to 5 appear and blink at the bottom of the display.

4. Enter a channel number ([1] to [5]) corresponding to your desired PM channel.
   • The settings are stored in the PM channel.

RECALLING PM CHANNELS

1. Press [PM].
   • PM channel numbers 1 to 5 and OFF appear on the bottom of the display.

2. Enter a channel number ([1] to [5]) corresponding to your desired PM channel.
   • The settings stored in the PM channel are recalled.
   • The selected channel number appears on the display.
   • When selecting [OFF], the PM channels turn off.

AUTO PM CHANNEL STORE

After you recall a PM channel, this function automatically overwrites the current PM channel with the present operating environment when:
• You recall another PM channel.
• You press [PM].
• You switch the transceiver power OFF.

Follow the steps below to activate the Auto PM storage function.

1. Enter Menu mode and access Menu 521.

2. Set to ON.

Note: If you do not register a PM channel (1 - 5), Menu No. 521 will not appear on the display.

PM CHANNEL RESET

To reset the PM channels to their default settings:

1. Turn the transceiver power OFF.
2. Press [F] + Power ON.
3. Release [F].
4. Rotate the Tuning control and select PM RESET.

5. Press the Tuning control.
   • A confirmation message appears on the display.

6. Press the Tuning control again to reset the PM channels.
   • Press [BACK] to return to the previous display.
   • To exit without resetting the PM channels, press [ESC].
Scan is a useful feature for hands-off monitoring of your favorite frequencies. Becoming comfortable with all types of Scan will increase your operating efficiency.

This transceiver provides the following types of scans:

<table>
<thead>
<tr>
<th>Scan Type</th>
<th>Scan Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>VFO Scan</td>
<td>Scans all frequencies on the current band.</td>
</tr>
<tr>
<td>Memory Scan</td>
<td>Scans all frequencies stored in the Memory channels.</td>
</tr>
<tr>
<td>Group Scan</td>
<td>Scans the frequencies in the Memory channels which belong to the group you have specified.</td>
</tr>
<tr>
<td>Program Scan</td>
<td>Scans all frequencies within the programmed range, on the current band.</td>
</tr>
<tr>
<td>MHz Scan</td>
<td>Scans all frequencies within a 1 MHz range from the originating frequency.</td>
</tr>
<tr>
<td>Call Scan</td>
<td>Scans the Call channel as well as the currently selected VFO frequency or Memory channel.</td>
</tr>
</tbody>
</table>

**Note:**
- Adjust the squelch level before using Scan. Selecting a squelch level too low could cause Scan to stop immediately.
- While using CTCSS or DCS, Scan stops for any signal received; however, you will hear audio only when the signal contains the same CTCSS tone or DCS code that you selected.
- When using S-meter Squelch, Scan stops when the received signal strength matches or exceeds the S-meter setting. Scan resumes 2 seconds after the signal level drops below the S-meter setting.
- Pressing and holding [PTT] causes Scan to temporarily stop if it is functioning on a non TX band.
- Starting Scan switches the Automatic Simplex Checker OFF.

**SELECTING A SCAN RESUME METHOD**

The transceiver stops scanning at a frequency or Memory channel on which a signal is detected. It then continues scanning according to which resume mode you have selected. You can choose one of the following modes. The default is Time-operated mode.

- **Time-Operated mode**
  The transceiver remains on a busy frequency or Memory channel for approximately 5 seconds, and then continues to scan even if the signal is still present.

- **Carrier-Operated mode**
  The transceiver remains on a busy frequency or Memory channel until the signal drops out. There is a 2 second delay between signal drop-out and scan resumption.

- **Seek mode**
  The transceiver remains on a busy frequency or Memory channel even after the signal drops out and does not automatically resume scanning.

**VFO SCAN**

VFO Scan monitors all frequencies tunable on the band, using the current frequency step size.

1. Select your desired band.
2. Press [VFO] (1s).
   - Scan starts at the current frequency.
   - The 1 MHz decimal blinks while scanning is in progress.
   - To reverse the scan direction, turn the Tuning control clockwise (upward scan) or counterclockwise (downward scan). You can also press microphone [UP]/[DWN].
3. To quit VFO Scan, press [VFO] again.

1. Enter Menu mode and access Menu 514.
2. Set the Scan Resume mode to TIME (Time-Operated), CARRIER (Carrier-Operated) or SEEK.
MEMORY SCAN

Use Memory Scan to monitor all Memory channels programmed with frequency data.

1 Select your desired band.

2 Press [MR] (1s).
   - Scan starts at the current frequency.
   - The 1 MHz decimal blinks while scanning is in progress.
   - To reverse the scan direction, turn the **Tuning** control clockwise (upward scan) or counterclockwise (downward scan). You can also press microphone [UP]/[DWN].

3 To quit Memory Scan, press [MR] again.

**Note:**
- At least 2 Memory channels must contain data and must not be locked out of scan.
- The L0/U0 to L9/U9 Memory channels will not be scanned.
- You can also start Memory Scan when in Channel Display mode. While Scan is paused on a channel, the channel number blinks.

### Locking Out a Memory Channel

You can select Memory channels that you prefer not to monitor while scanning.

1 Press [MR], then rotate the **Tuning** control to select your desired channel.

2 Enter Menu mode and access Menu 202.

3 Set the lockout to ON to lock the channel out of the scanning sequence.
   - To cancel lockout, set the lockout to OFF.
   - The \( \times \) icon appears on the display for a channel that has been locked out.

**Note:** The L0/U0 to L9/U9 Memory channels cannot be locked out.

GROUP SCAN

For the purpose of Group Scan, the 1000 Memory channels are divided into 10 groups, with each group containing 100 channels. Group Scan monitors only the 100 channels which belong to the specific group you are scanning. The channels are grouped as follows:

<table>
<thead>
<tr>
<th>Memory Group</th>
<th>Channel Range</th>
<th>Memory Group</th>
<th>Channel Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0 ~ 99</td>
<td>5</td>
<td>500 ~ 599</td>
</tr>
<tr>
<td>1</td>
<td>100 ~ 199</td>
<td>6</td>
<td>600 ~ 699</td>
</tr>
<tr>
<td>2</td>
<td>200 ~ 299</td>
<td>7</td>
<td>700 ~ 799</td>
</tr>
<tr>
<td>3</td>
<td>300 ~ 399</td>
<td>8</td>
<td>800 ~ 899</td>
</tr>
<tr>
<td>4</td>
<td>400 ~ 499</td>
<td>9</td>
<td>900 ~ 999</td>
</tr>
</tbody>
</table>

1 Press [MR], then rotate the **Tuning** control to select a channel in your desired group.

2 Press the **Tuning** control (1s).
   - Scan starts at the current channel.
   - The 1 MHz decimal blinks while scanning is in progress.
   - To reverse the scan direction, turn the **Tuning** control clockwise (upward scan) or counterclockwise (downward scan). You can also press microphone [UP]/[DWN].

3 To quit Group Scan, press the **Tuning** control again.

**Note:**
- At least 2 Memory channels in the selected group must contain data and must not be locked out of scan.
- You can also start Memory Scan when in Channel Display mode. While Scan is paused on a channel, the channel number blinks.

### Memory Group Link

Memory Group Link provides you with the ability to link 2 or more Memory channel groups together to act as a single group when scanning. You can link up to 10 separate groups together, or even add multiple instances of the same group to the group link, to ensure that one group is scanned more often than the other groups.

1 Enter Menu mode and access Menu 203.

2 Press the **Tuning** control.
   - The cursor will begin blinking.

3 Rotate the **Tuning** control to select a group to link.

4 Press the **Tuning** control to set the group and move the cursor to the right.
   - Press [+] to move the cursor back or [-] to move the cursor to the right.

5 Repeat steps 3 and 4 to link additional groups together.

6 When you have entered your desired groups, press [CLR] to move the cursor to the right, then press the **Tuning** control to complete the entry and exit Menu mode.
   - You can insert one space by pressing [SPACE].
   - You can insert a character by pressing [INS].
   - You can delete the selected character by pressing [CLR].
   - If you have entered the maximum of 6 groups, simply press the **Tuning** control to complete the entry and exit Menu mode.
PROGRAM SCAN

Program Scan is identical to VFO Scan except that you select a frequency range for the scan.

### Setting Scan Limits

You can store up to 10 scan ranges in Memory channels L0/U0 to L9/U9.

1. Press [VFO].
2. Select your desired band.
3. Rotate the Tuning control to select your desired frequency for the lower limit.
4. Press [F].
   - A memory channel number appears and blinks.
5. Rotate the Tuning control to select a channel from L0 to L9.
6. Press [M.IN] to set the channel number.
   - The lower limit is stored in the channel.
7. Rotate the Tuning control to select your desired frequency for the lower limit.
8. Press [F].
9. Rotate the Tuning control to select a matching channel number from U0 to U9.
   - For example, if you select channel L3 in step 5, select channel U3 here.
10. Press [M.IN] to set the channel number.
    - The upper limit is stored in the channel.
    - To confirm the stored scan limits, press [MR], then select the L and U channels.

**Note:**
- The lower limit must be lower in frequency than the upper limit.
- The lower and upper frequency step sizes must be equal.
- The lower and upper limits must be selected on the same band.

### Using Program Scan

1. Select your desired band.
2. Press [VFO].
3. Rotate the Tuning control to select a frequency within your desired scan range.
4. Press [VFO] (1s).
   - Scan starts at the current frequency.
   - The 1 MHz decimal blinks while scanning is in progress.
   - To reverse the scan direction, turn the Tuning control clockwise (upward scan) or counterclockwise (downward scan). You can also press microphone [UP]/[DWN].
5. To quit Program Scan, press [VFO] again.

**Note:**
- If the step size differs between the lower limit and upper limit, VFO scan will begin instead of Program Scan.
- If the current VFO frequency is within more than one Program Scan range, the range stored in the smallest channel number is used.

### MHz SCAN

MHz Scan monitors a 1 MHz segment of the band, using the current frequency step size. The current 1 MHz digit determines the limits of the scan. For example, if the current frequency is 145.400 MHz, then the scan range would be from 145.000 MHz to 145.995 MHz (the exact upper limit depends on the current frequency step size).

1. Select your desired band.
2. Press [VFO].
3. Rotate the Tuning control to select a frequency within your desired 1 MHz range.
4. Press and hold the Tuning control for 1 second to start scanning.
   - Scan starts at the current frequency.
   - The 1 MHz decimal blinks while scanning is in progress.
   - To reverse the scan direction, turn the Tuning control clockwise (upward scan) or counterclockwise (downward scan). You can also press microphone [UP]/[DWN].
5. To quit MHz Scan, press the Tuning control again.

### CALL SCAN

Use Call Scan to monitor both the Call channel and either the currently selected VFO frequency or the currently selected Memory channel.

1. Select your desired VFO frequency or Memory channel.
2. Press [CALL] (1s) to start Call Scan.
   - The 1 MHz decimal blinks while scanning is in progress.
   - When scanning a Memory channel, the Call channel on the same band as the selected Memory channel is used for scan.
3. To quit Call Scan, press [CALL] again.

**Note:** The Memory channel selected is scanned even if it has been locked out of scan.
VISUAL SCAN

While you are receiving, Visual Scan allows you to monitor frequencies near the current operating frequency. Visual Scan graphically and simultaneously shows how all frequencies in the selected range are busy. You will see up to 21 segments, for each channel, that represent 7 S-meter levels (3 segments per level).

Determine the scan range by selecting the center frequency and the number of channels. The default number of channels is 61.

Selecting the Number of Channels

1. Enter Menu mode and access Menu 515.

2. Set the number of channels to MODE 1 (31ch), MODE 2 (61ch), MODE 3 (91ch), or MODE 4 (181ch).

Using Visual Scan

1. Select your desired band.
2. Rotate the Tuning control select the operating frequency.
   - This frequency will be used as the center frequency.
3. Press [F], [VISUAL] to start Visual Scan.
   - To halt Scan, press [PAUSE]. “PAUSE” appears and blinks. Press [PAUSE] again to resume.
4. To change the operating frequency, rotate the Tuning control.
   - The displayed frequency changes and the cursor moves.
   - Press [SET] to use the changed operating frequency as the center frequency.
   - Press [RESET] to restore the previous operating frequency.
5. To exit Visual Scan, press [ESC].

Note:
- You cannot use the Visual Scan Function under the following circumstances:
  - When the Built-in TNC is turned ON.
  - When only 1 channel has been stored in the memory channels.
  - When using Weather Alert (K models only).
- If you start Visual Scan in Memory Recall mode, the memory channel frequencies will be scanned.
- If you start Visual Scan after recalling the Call channel, the Call channel frequency will be used as the center frequency.
- If the frequency range specified for Program Scan or Program VFO is narrower than the range specified for Visual Scan, the range for Program Scan or VFO will be used for Visual Scan.
- Visual Scan stops while transmitting.
- If you start Visual Scan in one of the following conditions, you cannot receive in the current operating frequency. To use this frequency, press [PAUSE] to halt Scan.
  - Memory Recall or Call Channel mode.
  - A frequency in the 118, 220, 300, or 1200 MHz band was selected in VFO mode.
- Depending on the transceiver conditions, Visual Scan and the conventional S-meter may indicate different signal strength levels.
CONTINUOUS TONE CODED SQUELCH SYSTEM (CTCSS)

You may sometimes want to hear calls only from specific persons. The Continuous Tone Coded Squelch System (CTCSS) allows you to ignore (not hear) unwanted calls from other persons who are using the same frequency. To do so, select the same CTCSS tone as selected by the other persons in your group. A CTCSS tone is subaudible and is selectable from among 42 tone frequencies.

Note: CTCSS does not cause your conversation to be private. It only relieves you from listening to unwanted conversations.

USING CTCSS

1 Select your desired band.
2 Press [TONE] 2 times to activate the CTCSS function.
   - The CT icon appears on the display when the CTCSS function is ON.
   - Each press of [TONE] changes the selection as follows: Tone (T) -> CTCSS (CT) -> DCS (DCS) -> Off (no display).
3 Press [F], [T.SEL].
   - The current CTCSS frequency appears on the display and blinks.
4 Rotate the Tuning control to select your desired CTCSS frequency.
   - Refer to the table below for available frequencies.
   - To exit the CTCSS frequency selection, press [ESC].
5 Press any key other than the Tuning control and [ESC] to complete the setting.
6 When you are called: The transceiver squelch opens only when the selected CTCSS tone is received.
   When you make a call: Press and hold [PTT], then speak into the microphone.
   - To cancel CTCSS, press [TONE] until CT no longer appears on the display.

You can also select a CTCSS frequency by using the microphone:
1 Select your desired band.
2 Press [TONE] 2 times to activate the CTCSS function.
   - The CT icon appears on the display when the CTCSS function is ON.
   - Each press of [TONE] changes the selection as follows: Tone (T) -> CTCSS (CT) -> DCS (DCS) -> Off (no display).
3 Press [F], [T.SEL].
   - The current CTCSS frequency appears on the display and blinks.
4 Press the key programmed as [ENTER].

CTCSS FREQUENCY ID

This function scans through all CTCSS frequencies to identify the incoming CTCSS frequency on a received signal. You may find this useful when you cannot recall the CTCSS frequency that the other persons in your group are using.

1 Press [TONE] 2 times to activate the CTCSS function.
   • The C icon appears on the display when the CTCSS function is ON.
   • Each press of [TONE] changes the selection as follows:
     Tone (T) -> CTCSS (C) -> DCS (DCS) -> Off (no display).

2 Press [F], [T.SEL] (1s).
   • The C icon blinks and “SCAN” appears on the display.
   • Scan starts when a signal is received.

   * ESC

   • To reverse the scan direction, turn the Tuning control clockwise (upward scan) or counterclockwise (downward scan). You can also press microphone [UP]/[DWN].
   • To quit the scan, press [ESC].
   • When a CTCSS frequency is identified, the identified frequency appears on the display and blinks.

   * ESC

3 Press the Tuning control to program the identified frequency in place of the currently set CTCSS frequency.
   • The CTCSS function will remain ON. To cancel CTCSS, press [TONE] until CT no longer appears on the display.
   • Press [ESC] if you do not want to program the identified frequency.
   • Rotate the Tuning control while an identified frequency is blinking, to resume scanning.
DIGITAL CODED SQUELCH (DCS)

Digital Code Squelch (DCS) is another application which allows you to ignore (not hear) unwanted calls. It functions the same way as CTCSS. The only differences are the encode/decode method and the number of selectable codes. For DCS, you can select from 104 different codes.

USING DCS

1. Select your desired band.
2. Press [TONE] 3 times to activate the DCS function.
   - The DCS icon appears on the display when the DCS function is ON.
   - Each press of [TONE] changes the selection as follows:
     Tone (T) → CTCSS (C) → DCS (DCS) → Off (no display).
3. Press [F], [T.SEL].
   - The current DCS code appears on the display and blinks.
4. Rotate the Tuning control to select your desired DCS code.
   - Refer to the table below for the available codes.
   - To exit the DCS code selection, press [ESC].
5. Press any key other than the Tuning control and [ESC] to complete the setting.
6. When you are called: The transceiver squelch opens only when the selected DCS code is received. When you make a call: Press and hold [PTT], then speak into the microphone.
   - To cancel DCS, press [TONE] until DCS no longer appears on the display.
   - You can also select a DCS code by using the microphone:
     1. Select your desired band.
     2. Press [TONE] 3 times to activate the DCS function.
        - The DCS icon appears on the display when the DCS function is ON.
        - Each press of [TONE] changes the selection as follows:
          Tone (T) → CTCSS (C) → DCS (DCS) → Off (no display).
     3. Press [F], [T.SEL].
        - The current DCS code appears on the display and blinks.
     4. Press the key programmed as [ENTER].
        - The DCS code blinks on the display.
     5. Enter your desired DCS code using the microphone keypad.
        - Refer to the table below for DCS codes.

DCS CODE ID

This function scans through all DCS codes to identify the incoming DCS code on a received signal. You may find it useful when you cannot recall the DCS code that the other persons in your group are using.

1. Press [TONE] 3 times to activate the DCS function.
   - The DCS icon appears on the display when the DCS function is ON.
   - Each press of [TONE] changes the selection as follows:
     Tone (T) → CTCSS (C) → DCS (DCS) → Off (no display).
2. Press [F], [T.SEL] (1s).
   - The DCS icon blinks and “SCAN” appears on the display.
   - Scan starts when a signal is received.
   - To reverse the scan direction, turn the Tuning control clockwise (upward scan) or counterclockwise (downward scan). You can also press microphone [UP]/[DWN].
   - To quit the scan, press [ESC].
   - When a DCS code is identified, the identified code appears on the display and blinks.
   - Press [ESC] if you do not want to program the identified code.
   - Rotate the Tuning control while an identified code is blinking, to resume scanning.

DCS-1
DUAL TONE MULTI-FREQUENCY (DTMF)

The keys on the microphone keypad function as DTMF keys; the 12 keys found on a push-button telephone plus 4 additional keys (A, B, C, D). This transceiver provides 10 dedicated memory channels. You can store a DTMF code with up to 16 digits.

Some repeaters in the U.S.A. and Canada offer a service called Autopatch. You can access the public telephone network via such a repeater by sending DTMF tones. For further information, consult your local repeater reference.

MANUAL DIALING

Manual Dialing requires only two steps to send DTMF tones.

1 Press and hold the microphone [PTT].

2 Press the keys in sequence on the keypad to send DTMF tones.
   • The corresponding DTMF tones are transmitted.
   • If the DTMF Hold function is activated, you need not hold down [PTT] while pressing keys. After transmitting the first tone (by pressing [PTT] and the first key), pressing additional keys will keep the transceiver in transmit mode for 2 seconds.

**DTMF Hold**

Activate this function to remain in transmit mode, after beginning to press keys when making a call.

1 Enter Menu mode and access Menu 300.

2 Set DTMF Hold to ON to continue transmitting when pressing keys.
   • Set this menu to OFF to stop the 2 second continuous transmission.

AUTOMATIC DIALER

There are 10 dedicated DTMF Memory channels available to store DTMF codes. You can store up to 16 digits in each channel.

### Storing a DTMF Code in Memory

1 Enter Menu mode and access Menu 301.

2 Rotate the Tuning control to select a channel number.

3 Press the Tuning control to set the selected channel number.
   • The name entry display appears.

4 Enter a name for the channel, then press the Tuning control to set it.
   • The code entry display appears.

5 Enter a DTMF code for the channel, then press the Tuning control to set it.
   • When a space is entered, it becomes a “Pause” code.
## Transmitting Stored DTMF Codes

1. Press and hold the microphone [PTT].
2. While transmitting, press the Tuning control.
   - The last called DTMF Memory channel name and number appear on the display. If no name has been saved for the channel, the DTMF code appears.
3. While still transmitting, rotate the Tuning control to select your desired DTMF Memory channel, then press the Tuning control to set the channel.
   - Additionally, you can press a DTMF key corresponding to your desired channel ([0] – [9]) to select the channel and begin transmission.
   - The stored DTMF code scrolls across the display and is transmitted.
   - The code will be transmitted even if you release [PTT] before the entire code has scrolled across the display.
   - If no DTMF code is stored in the selected channel, the frequency display is restored.

## Selecting a Transmit Speed

Some repeaters may not respond correctly if a DTMF code is transmitted at fast speed. If this happens, change the DTMF code transmission speed from FAST (default) to SLOW.

1. Enter Menu mode and access Menu 302.
2. Set the speed to FAST or SLOW.

## Selecting a Pause Duration

You can change the pause duration stored in DTMF Memory channels; the default is 500 msec.

1. Enter Menu mode and access Menu 303.
2. Select a speed (in msec) from the available list: 100/250/500/750/1000/1500/2000.

## DTMF Key Lock

This function will lock the DTMF transmission keys so that they will not transmit if they are accidentally pressed. To lock the DTMF keys, turn this function ON.

1. Enter Menu mode and access Menu 304.
2. Set the key lock to ON or OFF.
EchoLink®

WHAT IS EchoLink?

EchoLink allows you to communicate with other amateur radio stations over the internet, using VoIP (voice-over-IP) technology. The EchoLink software program allows worldwide connections to be made between stations, or from computer to station, greatly enhancing your communications capabilities.

To use EchoLink, you must register using your call sign on their website and download the EchoLink software program (free of charge). Refer to the website for PC hardware and other requirements.

Official EchoLink Website: http://www.echolink.org

Note: EchoLink is a registered trademark of Synergenics, LLC.

SETTING UP EchoLink Sysop MODE

Connect the TM-D71 to a personal computer to use the system as a node station for EchoLink relaying.

When connecting to a personal computer and using the EchoLink Sysop mode, the hard flow control operation RTS and CTS computer terminals operate the same as and are changed with the SQC (squelch control signal output to the computer) and PKS (transmit control signal input from the computer) data terminals.

The current band becomes the same as the data band which is selected in menu No. 517, regardless of the transmission band and operation band.

Use the PG-5H (interface cable kit) when connecting to a personal computer.

1. Turn the transceiver power OFF.
2. Press [PF2] + Power ON to turn EchoLink Sysop Mode ON.
   - The icon appears on the display when EchoLink Sysop mode is ON.
   - When the MCP-2A “EchoLink RX Monitor” is turned ON and an audio signal is output to the PC side, the icon blinks.
   - To turn EchoLink Sysop Mode OFF, press [PF2] + Power ON again.

Note:
- You cannot use EchoLink Sysop mode when the built-in TNC is turned ON.
- We recommend you set Menu 520’s SQC output setting to SQL when using EchoLink Sysop mode.
- When using CTCSS or DCS, set the EchoLink “RX Monitor” function to “Busy only” (this can only be set with the MCP-2A) to verify the usage condition of the operating frequency. Because of this, when EchoLink Sysop mode is ON, all received signals on the DATA band side are output through the speaker, regardless of CTCSS and DCS mismatch. (Only when CTCSS or DCS matches, the voice signal is output from the data terminal.)
- When EchoLink Sysop mode is ON, it cannot communicate with the MCP-2A. When using the MCP-2A, be sure to turn EchoLink Sysop mode OFF.
STORING EchoLink MEMORY

There are 10 dedicated EchoLink DTMF Memory channels available. You can store up to 8 digits in each channel.

1. Enter Menu mode and access Menu 204.

   ![EchoLink MEMORY 204](image)

2. Rotate the Tuning control to select an EchoLink channel number from EL0 ~ EL9.

3. Press the Tuning control to set the selected channel number.
   - The name entry display appears.

   ![EchoLink MEMORY NAME 204](image)

4. Enter the name for the channel, then press the Tuning control to set it.
   - The call sign and conference name (for board rooms that can do round QSO) of the other station which is connected via EchoLink, or the control command name, etc., are entered into the EchoLink memory name.
   - The code entry display appears.

   ![EchoLink MEMORY CODE 204](image)

5. Enter a DTMF code for the channel, then press the Tuning control to set it.
   - The node number of the other station and conference which are connected via EchoLink, or the DTMF code of the control command, etc., are entered into the EchoLink code.

Transmitting EchoLink Memory

1. Press and hold the microphone [PTT].

2. While transmitting, press the Tuning control.
   - The last called EchoLink DTMF Memory channel name and number appears on the display.

3. While still transmitting, rotate the Tuning control to select your desired EchoLink Memory channel, then press the Tuning control to set the channel.
   - The stored code scrolls across the display and is transmitted.

Note:
- In step 2, press the microphone [C] key before pressing the Tuning control, to transmit the converted DTMF code of the EchoLink “Connect by Call” function. (example: JA1YKK)
  “C” “51 21 10 93 52 92 #” (# is automatically added to the end of the DTMF code)
- In step 2, press the microphone [0][7] keys before pressing the Tuning control, to transmit the converted DTMF code of the EchoLink “Query by Call” function. (example: JA1YKK)
  “0” “7” “51 21 10 93 52 92 #” (# is automatically added to the end of the DTMF code)
- When only the EchoLink memory name has been registered, the EchoLink “Connect Call” function transmits the converted DTMF code. (example: JA1YKK)
  “C” “51 21 10 93 52 92 #” (C is automatically added to the beginning of the DTMF code and # is automatically added to the end)
- Call Sign/ DTMF Code Conversion Table
  When a character other than an alphanumeric character is used (such as “-” and “/”), the DTMF conversion stops at the character before that non-standard character.

Selecting a Transmit Speed

Some repeaters may not respond correctly if a code is transmitted at fast speed. If this happens, change the EchoLink transmission speed from FAST (default) to SLOW.

1. Enter Menu mode and access Menu 205.

   ![EchoLink SPEED 205](image)

2. Set the speed to FAST or SLOW.
OTHER OPERATIONS

POWER ON MESSAGE
Each time you switch the transceiver ON, “HELLO” (default) appears on the display for approximately 2 seconds. You can program your favorite message in place of the default message.
1. Enter Menu mode and access Menu 500.
   - 
   - Enter your desired message.
     • Press [CLR] to clear the entire message, if necessary.

DISPLAY ILLUMINATION
You can manually change the display illumination to suit the lighting conditions where you are operating.
1. Enter Menu mode and access Menu 501.
2. Set your desired brightness level from 1 to 8, or OFF.
   - Auto Display Brightness
   When Auto Brightness is activated, the display will light up every time a key is pressed.
   1. Enter Menu mode and access Menu 502.
   2. Set the Auto Brightness function to ON or OFF.
   - Backlight Color
   You can manually change the display illumination to suit the lighting conditions where you are operating.
   1. Enter Menu mode and access Menu 503.
   2. Set the backlight color to AMBER or GREEN.

Display Contrast
The display visibility changes depending on the ambient conditions, for example between daytime and night. When you find the display is not clear, use this function to select the optimum display contrast.
1. Enter Menu mode and access Menu 504.
2. Set your desired contrast level from 1 to 16.
   - Positive/ Negative Reversal
   You can change the display status between Negative and Positive (default).
   1. Enter Menu mode and access Menu 505.
   2. Set the backlight color to NEGATIVE or POSITIVE.

KEY LOCK
The Key Lock function ensures that your transceiver settings will remain unchanged if you accidentally press a key. When activated, the following functions can still be used:
• [dB]
• [PTT]
To turn Key Lock ON or OFF, press [F] (1s).
• When Key Lock is activated, the lock icon will appear on the display.

Microphone Key Lock
The Microphone Key Lock function will lock the microphone PF (Programmable Function) keys.
1. Enter Menu mode and access Menu 513.
2. Turn the Microphone Key Lock function ON or OFF.
KEY BEEP
You can turn the transceiver beep function ON or OFF as desired.

1. Enter Menu mode and access Menu 000.

   ![Menu 000](image)

2. Turn the beep function ON or OFF.
   • Even with the beep function turned OFF, the transceiver will emit a beep tone under the following conditions:
     1) When Auto Power Off is activated, the transceiver will beep 1 minute before the power turns off.
     2) After transmitting for the maximum time duration according to the Time-out Timer, the transceiver will beep.

Beep Volume
Each time you press a key, the beep tone will sound. If you have left the beep function turned ON, you may wish to adjust the volume level of the beep.

1. Enter Menu mode and access Menu 001.

   ![Menu 001](image)

2. Set the beep volume to a level from 1 to 7.
   • The default is level 5.

EXTERNAL SPEAKER CONFIGURATION
This transceiver has two speaker jacks for external speakers, as well as an internal speaker. You can enjoy a variety of speaker configurations by using one or two external speakers. Received signals on bands A and B are output depending on how you want the internal and/or external speakers to function.

1. Enter Menu mode and access Menu 002.

   ![Menu 002](image)

2. Set the speaker mode to MODE 1 or MODE 2.
   • Refer to the table below for configurations based on the mode selected.

<table>
<thead>
<tr>
<th>Mode</th>

</table>

PROGRAMMABLE VFO
If you always check frequencies within a certain range, you can set upper and lower limits for frequencies that are selectable. For example, if you select 144 MHz for the lower limit and 145 MHz for the upper limit, the tunable range will be from 144.000 MHz to 145.995 MHz.

1. Select your desired VFO frequency.

2. Enter Menu mode and access Menu 100. (Example: E type)

   ![Menu 100](image)

3. Press the Tuning control.
   • The lower frequency limit blinks.

4. Rotate the Tuning control to select your desired lower frequency limit, then press the Tuning control to set the selected value.
   • The upper frequency limit blinks.

5. Rotate the Tuning control to select your desired upper frequency limit, then press the Tuning control to set the selected value.

Note: You cannot program the 100 kHz and subsequent digits. The exact 100 kHz and subsequent digits of the upper limit depend on the frequency step size you are using.
CHANGING THE FREQUENCY STEP SIZE

Choosing the correct frequency step size is essential in selecting your exact frequency. The default step size on the 144 MHz band is 5 kHz (K type) or 12.5 kHz (E, M4 types). The default on the 430/440 MHz band is 25 kHz (K, E types) or 10 kHz (M4 type).

1. Press the left or right [BAND SEL] to select band A or B, then press [VFO].

2. Enter Menu mode and access Menu 101.

3. Set the step size to 5.0°, 6.25°, or 8.33 kHz (118 MHz band only) or to 10.0, 12.5, 15.0°, 20.0, 25.0, 30.0, 50.0, or 100.0 kHz.

   * These step sizes are not available for the 1200 MHz band.

   Note: Changing between step sizes may correct the displayed frequency. For example, if 144.995 MHz is displayed with a 5 kHz step size selected, changing to a 12.5 kHz step size corrects the displayed frequency to 144.9875 MHz.

PROGRAMMABLE FUNCTION KEYS

- **Transceiver Front Panel**

  There are 2 PF (Programmable Function) keys on the transceiver front panel: PF1 and PF2. You can assign your own desired functions to these 2 keys.

  1. Enter Menu mode and access Menu 507 (PF1) and/or Menu 508 (PF2).

  2. Set your desired function for the key. Programmable functions available are: WX CH (Weather Channel)/ FRQ.BAND (Frequency bands)/ CTRL (Control)/ MONITOR (Monitor)/ VGS (Voice recorder)/ VOICE (Voice announcement)/ GROUP UP (Memory group up)/ MENU (Menu mode)/ MUTE (Speaker Mute)/ SHIFT (Shift)/ DUAL (Dual Mode)/ M>V (Memory to VFO Copy)/ VFO/ MR/ CALL/ MHz/ TONE/ REV (Reverse)/ LOW/ LOCK/ A/B (Band Select A/ Band Select B)/ ENTER/ 1750 (1750 Hz Tone).

- **Microphone Keys**

  There are 4 microphone PF (Programmable Function) keys: [PF] (PF1), [MR] (PF2), [VFO] (PF3) and [CALL] (PF4). You can assign your own desired functions to these 4 keys.

  1. Enter Menu mode and access Menu 509 (MIC. PF1) and/or Menu 510 (MIC. PF2) and/or Menu 511 (MIC. PF3) and/or Menu 512 (MIC. PF4).

  2. Set your desired function for the key. Programmable functions available are: WX CH (Weather Channel)/ FRQ.BAND (Frequency bands)/ CTRL (Control)/ MONITOR (Monitor)/ VGS (Voice recorder)/ VOICE (Voice announcement)/ GROUP UP (Memory group up)/ MENU (Menu mode)/ MUTE (Speaker Mute)/ SHIFT (Shift)/ DUAL (Dual Mode)/ M>V (Memory to VFO Copy)/ VFO/ MR/ CALL/ MHz/ TONE/ REV (Reverse)/ LOW/ LOCK/ A/B (Band Select A/ Band Select B)/ ENTER/ 1750 (1750 Hz Tone).

FREQUENCY DIRECT ENTRY

If the desired operating frequency is far from the current frequency, using the microphone keypad is the quickest way to change the frequency. One of the microphone PF keys must first be programmed as [ENTER].

1. Press the left or right [BAND SEL] to select band A or B, then press [VFO] or [CALL].

2. Press the key programmed as [ENTER].

3. Press the microphone keys ([0] ~ [9]) to enter your desired frequency.

4. To set the entered frequency, press [ENTER] or [VFO].

   - Pressing [ENTER] before entering all of the digits will set the remaining digits to 0.
   - Pressing [VFO] before entering all of the digits will leave the remaining digits at their previous values.
   - Entering all digits for a frequency will automatically set the frequency without pressing [ENTER] or [VFO].
   - If you need to only change the MHz digit, press the Tuning control, then enter the new value.
AUTOMATIC POWER OFF (APO)
Automatic Power Off is a background function that monitors whether or not any operations have been performed (keys pressed, Tuning control turned, etc.), and turns the transceiver power OFF if it has not been in use.

1. Enter Menu mode and access Menu 516 (APO).

2. Set the APO time limit to 30, 60, 90, 120, 180 minutes, or OFF.
   - After the time limit passes with no operations (default is OFF), APO turns the transceiver power OFF. However, 1 minute before the power turns OFF, "APO" appears on the display and blinks, and a warning tone sounds.

   Note: If any settings are changed during while APO is ON, the timer resets. When you stop changing the settings, the timer begins counting again from 0.

SWITCHING FM/AM MODE
This transceiver is also capable of receiving (not transmitting) in AM on band A. The default mode on the 118 MHz band is AM while the default on the 144, 220, 300, or 430/440 MHz band is FM.

1. Enter Menu mode and access Menu 102.

2. Set the mode to AM, FM, or NFM.
   - Note: You cannot switch between FM and AM to receive on band B.

ADVANCED INTERCEPT POINT (AIP)
The VHF/UHF band is often crowded in urban areas. AIP helps eliminate interference and reduce audio distortion caused by inter modulation. You can use this function only while operating on the VHF/UHF band.

1. Enter Menu mode and access Menu 103 (VHF.AIP) and/or Menu 104 (UHF.AIP).

2. Set the AIP to ON or OFF.

S-METER SQUELCH
S-meter Squelch causes the squelch to open only when a signal with the same or greater strength than the S-meter setting is received. This function relieves you from constantly resetting the squelch when receiving weak stations that you have no interest in.

1. Enter Menu mode and access Menu 105.

2. Set the S-Meter squelch to ON or OFF.

3. To select the desired S-meter setting, rotate the left (band A) or right (band B) SQL control depending on which band you have selected.
   - The squelch will open only at the level you have selected (for example, level 9).

   Note: You cannot switch between FM and AM to receive on band B.

Squelch Hang-up Time
When using S-meter Squelch, you may want to adjust the time interval between when the received signals drop and when the squelch closes.

1. Enter Menu mode and access Menu 106.

2. Set the hang-up time to 125, 250 or 500 ms, or OFF.
**SPEAKER MUTE**

While receiving or transmitting on the TX band, you may not want to hear audio received on the other band. Use this function to mute the speaker allocated to that band (not the TX band).

While receiving, press [F], [MUTE] to switch the mute function ON or OFF.

- The MUTE icon appears on the display when the function is ON.

**Mute Hang-up Time**

When using Speaker Mute, you may want to adjust the time interval between when you receive a signal and when the speaker is muted.

1. Enter Menu mode and access Menu 107.
2. Set the hang-up time to 125, 250, 500, 750, or 1000 ms.

**BEAT SHIFT**

Since the transceiver uses a microprocessor to control various transceiver functions, the CPU clock oscillator’s harmonics or image may appear on some spots of the reception frequencies. In this case, we recommend you turn the Beat Shift function ON.

1. Enter Menu mode and access Menu 108.
2. Set the Beat Shift to ON or OFF.

**SELECTING AN OUTPUT POWER**

It is a good idea to select lower transmit power if communications is still reliable. This lowers the risk of interfering with others on the band. When operating from battery power, you will enjoy more operating time before a recharge is necessary.

Press [LOW] to select high (H) (K, E types only), medium (M), or low (L) power.

- You can program different power settings for bands A and B.

**TIME-OUT TIMER (TOT)**

It is sometimes necessary or desirable to restrict a single transmission to a specific maximum time. You may use this function to prevent repeater time-outs when accessing repeaters, or to conserve battery power.

When TOT times out (default is 10 minutes), the transceiver generates beeps and automatically returns to receive mode. To resume transmitting, release and then press the microphone [PTT] again.

1. Enter Menu mode and access Menu 109.
2. Set the timer to 3, 5, or 10 minutes.

**MASKING A BAND**

If you have no plans to use band A or B, you can hide the frequency display on the unused band. This saves power consumption and makes it simpler to read the information you need.

1. Turn the transceiver power OFF.
2. Press the left or right [BAND SEL] + Power ON.
   - The band mask display appears.
3. Rotate the Tuning control to select the band you want to hide (or return to normal).
4. Press the Tuning control to set the selected band.
5. Rotate the Tuning control to set the band to select USE or MASK.
   - USE allows you to see and use the band as normal.
   - MASK hides the band on the display.
6. Press the Tuning control to set the selection.
7. Press the [ESC] to exit.

**Note:** You cannot operate the masked band nor use it to receive or transmit.

---

**Note:** When the transceiver overheats because of ambient high temperature or continuous transmission, the protective circuit may function to lower transmit output power.
DISPLAY PARTITION BAR

The partition bar that appears between bands A and B can be removed if desired.

1. Enter Menu mode and access Menu 527.

2. Set the partition bar display to ON or OFF.

POWER ON PASSWORD

If power on password is activated, you cannot operate the transceiver without first entering your password, after turning the transceiver power ON. Your password can be changed using the MCP-2A software, and can contain up to 6 digits.

1. Enter Menu mode and access Menu 998.

2. Set the power on password to ON or OFF.
   • When set to ON, "PASSWD" appears on the display.

3. Enter your password.

4. After entering up to 6 digits, press the Tuning control to set the password.

Note: Even with Menu 998 turned ON, the power on password function will not be activated unless you first program a password using the MCP-2A software.
PACKET OPERATION

Connect this transceiver to your personal computer via a Terminal Node Controller (TNC). You can send messages or commands to far away stations, obtain a variety of information via your local bulletin boards, or enjoy other Packet applications. Reference material for starting Packet operation should be available at any store that handles Amateur Radio equipment.

**Note:** When the distance between the radio antenna and your personal computer is too close, interference may occur.

### DATA terminal pins

- When using the built-in TNC, the DATA terminal is not used.

### PACKET MODE

This transceiver has a built-in TNC which conforms to the AX.25 protocol. This protocol is used for communications between TNCs.

For the commands supported by the built-in TNC, see “TNC COMMANDS LIST”.

Press [TNC] 2 times to enter PACKET mode.

The following indicators appear on the transceiver display to show the current TNC status:

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>PACKET</td>
<td>The TNC is in Packet mode.</td>
</tr>
<tr>
<td>STA</td>
<td>Packets to be transmitted still remain in the buffer.</td>
</tr>
<tr>
<td>CON</td>
<td>The TNC is in connection with the target station.</td>
</tr>
<tr>
<td>MBOD</td>
<td>The mailbox in the TNC is being accessed or connected by the other station.</td>
</tr>
<tr>
<td>MAIL</td>
<td>The mailbox in the TNC holds mail addressed to you.</td>
</tr>
<tr>
<td>12</td>
<td>1200 bps transfer rate selected</td>
</tr>
<tr>
<td>96</td>
<td>9600 bps transfer rate selected</td>
</tr>
</tbody>
</table>

**Note:**
- Not all functions available via conventional TNC’s are supported by the TNC built in this transceiver.
- The built-in TNC could be automatically reinitiated when its malfunction is detected; this does not designate that the transceiver is defective.
- To distinguish your various stations or nodes, you can have up to 15 Secondary Station Identifiers (SSIDs); ex. W6DJY-1 to W6DJY-15. You always have to put a dash between your call sign and SSID number.
- Packet operation, easily affected by transmit and receive conditions, requires a full-scale S-meter reading for reliable communication. When the S-meter reads less than maximum during 9600 bps operation, communication errors are frequent.

---

• When using the built-in TNC, the DATA terminal is not used.

• The PC terminal is on the rear of the TX/RX unit and the COM terminal is on the rear of the Operation panel. Connect these terminals to a personal computer.

---

• Not all functions available via conventional TNC’s are supported by the TNC built in this transceiver.

• The built-in TNC could be automatically reinitiated when its malfunction is detected; this does not designate that the transceiver is defective.

• To distinguish your various stations or nodes, you can have up to 15 Secondary Station Identifiers (SSIDs); ex. W6DJY-1 to W6DJY-15. You always have to put a dash between your call sign and SSID number.

• Packet operation, easily affected by transmit and receive conditions, requires a full-scale S-meter reading for reliable communication. When the S-meter reads less than maximum during 9600 bps operation, communication errors are frequent.
DATA BAND
Select how data will be transmitted and received on your transceiver.

1 Enter Menu mode and access Menu 529.

2 Set the data band to A-BAND (A band receives and transmits), B-BAND (B band receives and transmits), TX:A-BAND RX:B-BAND (A band transmits and B band receives), or RX:A-BAND TX:B-BAND (A band receives and B band transmits).

COM PORT SPEED
You can adjust the speed at which the computer and transceiver exchange information, when the transceiver is connected to your computer.

1 Enter Menu mode and access Menu 528.

2 Set the COM port speed to 9600, 19200, 38400, or 57600 bps.
   • Turning the power ON/OFF will change the port speed setting.

USING EXTERNAL TNC

External Data Band
1 Enter Menu mode and access Menu 517.

2 Set the data band to A-BAND (A band receives and transmits), B-BAND (B band receives and transmits), TX:A-BAND RX:B-BAND (A band transmits and B band receives), or RX:A-BAND TX:B-BAND (A band receives and B band transmits).

DATA Terminal Speed
Select 1200 or 9600 bps for the data transfer rate, depending on TNC.

1200 bps: Transmit data input (PKD) sensitivity is 40 mVp-p and input impedance is 10 kΩ.
9600 bps: Transmit data input (PKD) sensitivity is 2 Vp-p and input impedance is 10 kΩ.

1 Enter Menu mode and access Menu 518.

2 Set the data speed to 1200 or 9600 bps.

PC Port Speed

1 Enter Menu mode and access Menu 519.

2 Set the PC port speed to 9600, 19200, 38400, or 57600 bps.
   • Turning the power ON/OFF will change the port speed setting.

SQC Output Setting
You can set the condition for which the SQC output terminal becomes active.

1 Enter Menu mode and access Menu 520.

2 Set the SQC output activation method to one of the following:
   • OFF: SQC output remains inactive.
   • BUSY: When a signal is received on the data band, the SQC output becomes active.
   • SQL: While CTCSS/DCS is ON and a matching signal is received, the SQC output becomes active. While CTCSS/DCS is OFF, the SQC output becomes active when a busy signal is received.
   • TX: While transmitting, the SQC output becomes active.
   • BUSY.TX: When the conditions of BUSY and TX (above) are met, the SQC output becomes active.
   • SQL.TX: When the conditions of SQL and TX (above) are met, the SQC output becomes active.

Note: The activation type (logic) can be changed using the MCP-2A software.
The commands supported by the built-in TNC are listed below. You must enter a space between a command name (or short-form) and a parameter, or between two parameters; ex. AU OFF, BEACON EVERY 18.

</tbody>
</table>
The Automatic Packet/ Position Reporting System (APRS®) is a software program and registered trademark of Bob Bruninga, WB4APR. He has made packet communications much more exciting than before. This program allows you to track mobile stations on a map which you recall on a computer screen. Imagine seeing one mobile station moving on the map which can be scaled from 0.5 to 2000 miles. You also may be tracked on the computer screen of another station.

Stations to be tracked must transmit beacons at certain intervals. To track other stations, you usually need a computer running the APRS, a transceiver, and a TNC. To have them track you, you also need a GPS receiver. It receives signals from the satellites to inform you of your current geographical position. GPS stands for Global Positioning System. The APRS interprets the National Marine Electronics Association (NMEA) data strings coming from the GPS receiver. For further information, consult Internet Web pages relating to the APRS. On one of the Internet search engines, you may use “APRS” or “Packet Radio” as a key word to find those Web pages.

This transceiver includes a TNC and a program for dealing with data formats supported by the APRS. That is, you need no other equipment to transmit, receive, or display APRS packets. You do not need even a GPS receiver if you enter position data manually to transmit. For hams who want to fully enjoy APRS operations, this transceiver has connection ports with a personal computer and a GPS receiver. This manual, however, does not describe APRS operations which require a personal computer.

Using this transceiver, you can transmit a station icon, position data, position comment, and status text. With a GPS receiver, you can also transmit moving speed, moving direction, and altitude data. From any type of station you will receive information listed below:

<table>
<thead>
<tr>
<th>Station icon</th>
<th>Position data/ Grid square locator</th>
<th>Position comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status text</td>
<td>Distance from station</td>
<td>Direction of station</td>
</tr>
</tbody>
</table>

Depending on the types of stations, you will also receive the following information:

<table>
<thead>
<tr>
<th>Mobile station</th>
<th>Moving direction/ Moving speed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fixed station</td>
<td>Transmit power/ Height of antenna/ Antenna gain/ Antenna directivity</td>
</tr>
<tr>
<td>Fixed station (using compressed APRS data format)</td>
<td>Transmit range/ Altitude</td>
</tr>
<tr>
<td>Weather station</td>
<td>Wind direction/ Wind speed/ Temperature/ Rainfall in last hour</td>
</tr>
</tbody>
</table>

**PACKET PATH AND DIGIPEATER**

A packet path specifies how APRS packets should be transferred via one or more repeaters. A repeater, which is used for packet transfer, is commonly called a digipeater. This came from a “digital repeater”. A digipeater is usually located on a mountain top or high building. Unlike a voice repeater, it operates on a simplex frequency. Each volunteer who installs a digipeater programs it either as a WIDE or RELAY type. Generally a WIDE transmits packets over much greater distances than a RELAY.

In any given area, there should be only one WIDE not to cause extra traffic or collisions on frequencies. A WIDE is capable of transferring packets from and to adjacent WIDES. Like a WIDE, there should be only one RELAY in a given area; that area is usually much smaller than a WIDE. So, transmit packets to a RELAY when you cannot directly reach any WIDE. The RELAY then will transfer the packets to any accessible WIDE.

On this transceiver, you can edit a packet path using a maximum of 79 alphanumeric characters. The default is “RELAY,WIDE” hat is one of the common settings. With this setting, packets will be transferred to a RELAY first, then to a WIDE.
CONNECTING WITH A GPS RECEIVER OR WEATHER STATION

The GPS jack on this transceiver accepts a 2.5 mm (1/10") 3-conductor plug. If necessary, use the supplied cable to modify the cable end of your GPS receiver or Weather Station.

ADJUSTING THE INTERNAL CLOCK

This transceiver has a clock to manage information on when APRS packets are received. Use Menu Set-up to correct the current time, date, and if necessary the UTC offset; UTC stands for Universal Time Coordinated.

Note: The battery for the clock backup is built into the unit. When the power source is connected, the battery begins to charge. It takes approximately 12 hours to become fully charged.

Setting Time

1. Enter Menu mode and access Menu 525.
   - The first 2 digits blink.
   - Rotate the Tuning control to enter the current hour, then press the Tuning control.
     • To set 1 o'clock PM for example, select 13.
     • The next 2 digits blink.
   2. Rotate the Tuning control to enter the current minute, then press the Tuning control.
   3. Press [ESC] to exit Menu mode.

Setting UTC Offset

1. Enter Menu mode and access Menu 526.
   - Rotate the Tuning control to select the appropriate UTC offset, then press the Tuning control.
     • The selectable range is from +12:00 to –12:00 in steps of 15 minutes.
   2. Press [ESC] to exit Menu mode.

Setting Date

1. Enter Menu mode and access Menu 524.
   - The first 2 digits blink.
   - Rotate the Tuning control to enter the current month (K type) or day, then press the Tuning control.
     • The next 2 digits blink.
   2. Rotate the Tuning control to enter the current day (K type) or month, then press the Tuning control.
     • The last 2 digits blink.
   3. Rotate the Tuning control to enter the current year, then press the Tuning control.
   4. Press [ESC] to exit Menu mode.

APRS-2
RECEIVING APRS DATA

Each time a new APRS packet is received, the frequency display is interrupted to show information as below:

Position comment (or status text)
• The received APRS packet may include information on an object such as a hurricane or tornado. In this case, the name of the object appears instead of a call sign.
• Press [DETAIL] to access further information.
• To restore the frequency display, press [ESC] or just wait for approximately 10 seconds.

Note:
♦ When you receive an APRS packet including an “EMERGENCY” comment, a different format of display from the above will appear and a different beep will sound.
♦ When you receive an APRS position packet that you transmitted, the frequency display is not interrupted. “MY POSITION” will appear on the display. This could happen when one or more digipeaters are used. If you receive a message that you transmitted, “MY MESSAGE” will appear.

If a received packet does not include new (or proper) APRS data, the frequency display is not interrupted. An indicator such as “dP” appears depending on the types of data. See the table.

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>dP</td>
<td>Duplicate position comment</td>
</tr>
<tr>
<td>nP</td>
<td>New position data</td>

<td>Packet that cannot be decoded</td>
</tr>
<tr>
<td>dD</td>
<td>Duplicated DX cluster data</td>
</tr>
<tr>
<td>nD</td>
<td>New DX cluster data</td>
</tr>
</tbody>
</table>

¹ The transceiver automatically transmits the appropriate information in approximately 2 minutes after receiving a request.

ACCESSING RECEIVED APRS DATA

This transceiver is capable of receiving and storing APRS data received from up to 100 stations in memory. You can easily recall the information of the desired station.

1 Press [KEY], [LIST].
• The list of stations appears.
• The numbers beside the call signs indicate the order in which data is received. The data received last is assigned 1.

[TOP]: Displays the list of the fast 5 stations.
[51]: Displays the list of the previous 5 stations.
[5↓]: Displays the list of the next 5 stations.
[ESC]: Restores the frequency display.
[SORT]: To select the sort function
[FILTER]: To select the filter function
[MSG]: Allows message entry to the current station.
[TUNE]: Set the QSY frequency (APRS only).
[CLR]: Deletes the current station.
• Press [F].

2 Rotate the Tuning control to select the desired station using the cursor (↑).

3 Press the Tuning control.
• The information of the selected station appears.

[BACK]: Restores the list of stations.
[MSG]: Allows message entry to the current station.
[←]: Displays the previous page.
[→]: Displays the next page.
[TUNE]: Set the QSY frequency (APRS only).
[CLR]: Deletes the entire information of the current station.

Note:
♦ When data from the 101st station is received, the oldest data in memory is replaced by that data.
♦ Each time a new APRS packet is received from the same station, the old data from that station (in memory) is replaced by new data.
DISPLAY EXAMPLE

Page 1

①: Station icon  ②: Status text  ③: Call sign  ④: Date  ⑤: Time (packet received)  ⑥: Situation  ⑦: Direction of station  ⑧: Distance from station (mile or km)  ⑨: Position comment

1. For packets received from Mic-encoder stations including TM-D710s, TM-D700s and TH-D7s, position comments are displayed in the fourth line.

(Object)

①: Call sign  ②: Grid square locator

Page 2

(Mobile station)

①: Moving direction  ②: Moving speed (m: Mile/hour or k: km/hour)  ③: Altitude (` : Feet or M: Meter)

(Weather station)

①: Rainfall (" or mm)  ②: Air temperature  ③: Wind direction  ④: Wind velocity (mph: Mile/hour or kph: km/hour)  ⑤: Atmospheric pressure  ⑥: Humidity

(Fix station)

①: Transmit power  ②: Height of antenna (elevation) (` : Feet or M: Meter)  ③: Antenna gain  ④: Antenna directivity omni : Omnidirectional

Page 3

This transceiver is capable of displaying the following icons as station IDs.

<APRS>

<NAVITRA>

Some icons may appear with overlay characters as below if the received icon data includes them.

The following icons show the directions of stations relative to your position. For example, “=” indicates the other station is located at the northeast relative to your position.

0.0 to 9999 miles (or km) are shown for distances from other stations. “xxxxmi” (or “xxxxkm”) is shown for distances over 9999 miles (or km). If you do not change the position data in Menu 626 (DISPLAY UNIT 1 - SPEED, DISTANCE) from the default, “----mi” (or “----km”) is shown.

The default units for distance and temperature differ depending on market versions; mile/ °F for the U.S.A./ Canada version, and kilometer/ °C for the other market versions. If necessary, access Menu 626 (DISPLAY UNIT 1 - SPEED, DISTANCE) and/or Menu 626 (DISPLAY UNIT 1 - TEMPERATURE) to change the setting(s).

Note: Some stations transmit APRS packets through TNCs connected to GPS receivers. If you receive packets from those stations, “GOOD” (satellites tracked) or “LAST” (satellites not tracked) will be shown as the situation, with GLL, GGA, or RMC which designates $GPGLL, $GPGGA, or $GPRMC format.
**SORT FUNCTION**

This function allows you to sort the station list according to the call sign, date time, or distance.

1. Display the station list.
2. Press [SORT].
   - The sort type list appears on the display.
3. Select a sort type.
   - “SORTING” appears on the display and sorting begins.
4. The newly sorted station list appears on the display.

| CALLSIGN | All call signs are compared and arranged in ascending order. |
| DATE/TIME | All received dates and times are compared and arranged in descending order, with the last received message listed first. |
| DISTANCE | The distance between the other station and My station when selecting the sorting method is calculated, then compared and arranged in ascending order, with the closest station listed first. |

• After sorting, when new station data is received, it is added to the station list without resorting.

**FILTER FUNCTION**

This function allows you to select only the specified types of data from the station list.

1. Display the station list.
2. Press [FILTER].
   - The filter type list appears on the display.
3. Select a filter type.
   - “FILTERING” appears on the display and filtering begins.
4. The newly filtered station list appears on the display.

| DIGIPEATER | All icons are searched and those for digipeaters are displayed. |
| WEATHER | All icons are searched and those for the weather bureau are displayed. |
| MOBILE | All icons are searched and those for mobile bureaus are displayed. |
| OBJECT | DTI information is verified and only object bureaus are displayed. |
| KENWOOD | DTI information is verified and only Kenwood TH-D7, TM-D700, and TM-D710 bureaus are displayed. |
| NAVITRA | Received data is verified and only Navitra bureaus are displayed, starting from $PNTS. |
| FREQUENCY (QSY) | The status list is searched and only bureaus containing frequency (QSY) information are displayed. |
| OTHERS | Bureaus other than those listed above are displayed. |
| ALL(OFF) | The filtering function is cancelled. |

• After the filter function is turned ON, received data is added to the list but will not be displayed if it matches the filter type selected.
• For example, with the station list displayed and the filter selection set to “WEATHER”, all bureaus not relating to weather are no longer displayed. If mobile station data is received at this time, the new data will also not be displayed as long as the weather filter is active.
• DTI (Data Type Identifier) is a 1 byte code which shows the packet data classification.
RECEIVING A MESSAGE

Each time a proper message is received, the frequency display is interrupted to show information as below:

- **q**: Indicator
- **w**: Call sign (TX)
- **e**: Receive time
- **r**: Message
- **t**: TX/RX date
- **y**: Line number

- The display shows up to 67 characters of the message.
- "01" will appear to indicate the number of messages not yet read.
- The following indicators appear depending on the types of received messages:

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>Message addressed to you</td>
</tr>
<tr>
<td>B</td>
<td>Bulletin</td>
</tr>
<tr>
<td>!</td>
<td>Report by the National Weather Service</td>
</tr>
<tr>
<td>*</td>
<td>Reception acknowledgment (or rejection) to your message</td>
</tr>
<tr>
<td>G</td>
<td>Message group</td>
</tr>
</tbody>
</table>

To restore the frequency display after reading the message, press the Tuning control "01" will disappear. If you do not read the message at this time, press [ESC]. "01" will remain on the restored frequency display.

- The number increments if you press [ESC] for newly received messages. Checking them with the List function causes the number to decrement. If "01" was shown, both the number and message icon disappear.

When a duplicate message from the same station is received, an error beep sounds; however, an acknowledgment is returned. "dM" and a call sign appear on the display.

- When a message to other stations is received, "oM" appears.

Note:
- This transceiver allows you to receive a message also when the SSID does not match. However, it will not return a reception acknowledgment.
- The dedicated memory is used for storing both incoming and outgoing messages. Receiving a new message when the memory is full causes the oldest message to be deleted. A message not yet transmitted 5 times may be unexpectedly deleted. If the oldest message has not been accessed using the List function when memory is full, this transceiver will return a reject command and display "MF".
- This transceiver beeps each time it receives any type of APRS packet. You may access Menu 624 (SOUND-RX BEEP) to change this setting. The default is "ALL".

ENTERING A MESSAGE

To transmit a message, first enter the call sign of the target station. To transmit a bulletin, enter "BLN#" instead; where # must be 0 to 9 or A to Z. When the length of your bulletin exceeds 64 digits, you may transmit more than one packet to send the entire bulletin. Use # to indicate the sequence of the bulletin portions. For example, enter "BLNO" (or "BLNA") to send the first packet, then "BLN1" (or "BLNB") to send the second packet.

1. Press [KEY], [MSG].
2. Press [NEW] or [REPLY].
   - The display for entering a call sign appears; the first digit blinks. (When you press [REPLY], not necessarily)
3. Rotate the Tuning control to select the first digit.
   - You can enter 0 to 9, A to Z, and –.
4. Press [→].
5. The cursor moves to the next digit.
6. Rotate the Tuning control to complete the setting.
   - The display for entering a message appears; the first digit blinks.
7. Rotate the Tuning control to select the first digit.
8. Press [→].
9. The cursor moves to the next digit.
10. Repeat steps 7 and 8 to enter up to 67 digits.
11. Press the Tuning control to complete the setting.

The keypad on the microphone also is available to enter alphanumeric characters in steps 3 and 7.
ACCESSING RECEIVED APRS MESSAGES

This transceiver is capable of storing a maximum of 100 messages in memory. You can easily access one of those.

1 Press [KEY], [MSG].

- The newer message the smaller number assigned; the latest message is assigned 1.
- [POS]: Displays the latest position data of the current station, if stored in memory.

2 Rotate the Tuning control to select the desired message using the cursor (s).

3 Press the Tuning control.
- If you select an incoming message, the following display appears:

   - [BACK]: Restores the list of messages.
   - [NEW]: Create a new message.
   - [REPLY]: Responds to the party from whom you received. Enters into message setting.
   - [SEND]: Messages in the list that have not been sent are transmitted.
   - [POS]: The position data of the transmitting station is displayed (if the station data is available).
   - [CLR]: Deletes the current message.

- If you select one of your outgoing messages, the following display appears:

   - [BACK]: Restores the list of messages.
   - [NEW]: Create a new message.
   - [EDIT]: Responds to the party from whom you received. Enters into message setting.
   - [SEND]: All messages which can be transmitted will be sent 1 time.
   - [RE-TX]: When pressed for a message assigned a period (.), resets the retry counter to 5 more transmissions.
   - [CLR]: Cancels further transmissions of the current message.

The table below shows the meanings of the symbols to be shown in step 2.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>D</td>
<td>Message addressed to you</td>
</tr>
<tr>
<td>B</td>
<td>Bulletin</td>
</tr>
<tr>
<td>!</td>
<td>Report by the National Weather Service</td>
</tr>
<tr>
<td>🔄</td>
<td>Received message (or bulletin)</td>
</tr>
<tr>
<td>➡️</td>
<td>A message (or bulletin) for transmitting</td>
</tr>
</tbody>
</table>

TRANSMITTING A MESSAGE

When you press [SEND] on the “MESSAGE LIST” display, the remaining messages on the Message List will be transmitted.

After entering a message on the message display, pressing the Tuning Control will cause it to transmit every minute.
BASIC SETTING

Enter Menu mode and access Menu 600.

**My Call Sign <MY CALLSIGN>**

Program your call sign using a maximum of 9 alphanumeric characters. You may include SSID characters in the string. Unless you program a call sign, you cannot transmit APRS packets.

1. Select MY CALLSIGN.
   - The display for entering a call sign appears; the first digit blinks. The default is “NOCALL”.
2. Rotate the Tuning control to select the first digit.
   - You can enter 0 to 9, A to Z, and –.
3. Press the [→].
   - The cursor moves to the next digit.
4. Repeat steps 2 and 3 to enter up to 9 digits.

**Beacon Type <BEACON TYPE>**

- **[APRS]**: Select to APRS beacon.
- **[NAVITRA]**: Select to NAVITRA beacon.

SETTING INTERNAL TNC

Enter Menu mode and access Menu 601.

**Data Band <DATA BAND>**

On this transceiver you can select data band for APRS mode independent of the selection for Packet mode. Select band A or B as the data band for receiving or transmitting APRS packets. The default is band A. “B” indicates the current data band.

**Packet Transfer Rate <DATA SPEED>**

The default APRS packet transfer rate set on the built-in TNC is 1200 bps which is the standard among the current APRS networks. If APRS networks which use 9600 bps transfer rate become available in the future, select “9600 bps”

**DCD Sense <DCD SENSE>**

You can also select the method for inhibiting the built-in TNC from transmitting. Select one of the two methods. The default is “D or Rxd Band”.

- **[D or Rxd Band]**: The TNC does not transmit when signals are present on the data band (D) or RX data band (R:RX)
- **[Both Band]**: The TNC does not transmit when signals are present on band A or B.

SETTING GPS PORT

Enter Menu mode and access Menu 602

**Baud Rate <BAUD RATE>**

Set the communication speed of the external GPS or other equipment that is connected to the GPS terminal. The speed is set to 4800 bps (NMEA)/ 9600 bps (IPS format: SONY) when a GPS receiver is connected.
- It does not correspond to the Gamin-TXT format.

**Input Type <INPUT>**

- **[OFF]**: When using the GPS receiver
- **[GPS]**: When not using the GPS receiver
- **[WEATHER (Davis)]**: When using the weather observation device (Davis).
  - Operation verification model (currently July 2007) Vantage PRO2
- **[WEATHER (PeetBros.)]**: When using the weather observation device (PeetBros.).
  - Operation verification model (currently July 2007) ULTIMETER® 2100 (Packet mode)

**Differential Information Output <OUTPUT>**

When set to ON, can send the differential information from the GPS terminal to the GPS receiver.

**TX delay <TX DELAY>**

This function allows you to set a transmission delay time between transmitting the APRS data and transmitting a flag code prior to the APRS data. When the other station has activated their Save Mode, the selected delay time is increased.
SETTIMG WAY POINT
Enter Menu mode and access Menu 603.

Way Point Format <FORMAT>
Select the type of Way point Format that is sent.
[NMEA]: The data which is output from the GPS terminal using the NMEA-0183 "$GPWPL" format.
[MAGELLAN]: The data which is output from the GPS terminal using the "$PMGNWPL" format.
[KENWOOD]: The data which is output from the GPS terminal using the "$PKWDWPL" format.

Way Point Name <NAME>
Select the length of the Way Point Name. The length can be set as [6-CHAR], [7-CHAR], [8-CHAR] or [9-CHAR].

Way Point Output <OUTPUT>
[ALL]: All Way point information is sent.
[LOCAL]: If the position limit is ON, all the data within the position limit is sent. If the position limit is OFF, all Way point data is sent.
[FILTERED]: Information that is permitted using the packet filter is output as Way point information.

COM PORT ON/OFF
Enter Menu mode and access Menu 604.

Output <OUTPUT>
This function outputs data from the COM port after receiving packet and TNC command data from the APRS data communications. Use this function to verify the received data from the transceiver.

PROGRAMMING POSITION DATA
Enter Menu mode and access Menu 605.

Name Entry <NAME>
You can enter alphanumeric characters plus special ASCII characters (up to 8 digits).

Latitude Entry <LATITUDE>
The north/ south latitude is entered.

Longitude Entry <LONGITUDE>
The east/ west longitude is entered.

Note: When selecting GPS in Menu 602 (GPS PORT), the position information where it is set is not used.

SETTING BEACON INFORMATION
Enter Menu mode and access Menu 606.

Speed Information <SPEED>
Select whether or not to transmit speed information when using APRS data communications.

Altitude Information <ALTITUDE>
Select whether or not to transmit altitude information when using APRS data communications.
- When the beacon type is "NAVITRA", this information will not appear on the display.

Position Ambiguity <POSITION AMBIGUITY>
There may be cases where you do not know or do not want to report your precise locations. For position data, you can select the number of digits not to be included in your packets. Select 1 to 4, or OFF (default). The table shows how the digits are cleared.

<table>
<thead>
<tr>
<th>OFF</th>
<th>1-DIGIT</th>
<th>2-DIGIT</th>
<th>3-DIGIT</th>
<th>4-DIGIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>35°31.84</td>
<td>35°31.8</td>
<td>35°31.</td>
<td>35°</td>
<td>35°</td>
</tr>
<tr>
<td>139°37.42</td>
<td>139°37.4</td>
<td>139°37.</td>
<td>139°3</td>
<td>39°</td>
</tr>
</tbody>
</table>

- When the beacon type is "NAVITRA", this information will not appear on the display.
SELECTING A POSITION COMMENT
Enter Menu mode and access Menu 607.

The APRS data which you transmit always includes one of the 15 predetermined position comments. Select an appropriate comment depending on your situation.
The selectable comments are listed below:
[Off Duty] [Enroute] [In Service] [Returning] [Committed] [Special] [PRIORITY] [CUSTOM 0 ~ CUSTOM 6] [EMERGENCY!]
• If you select “Emergency!”, a confirmation message appears. Press the Tuning control again.

STORING STATUS TEXT
Enter Menu mode and access Menu 608.

Status text is another comment to transmit with position data. Unlike a position comment, you can make any desired comment using a maximum of 42 alphanumeric characters. This transceiver has 5 memory channels for preprogramming.

Note: Attaching a long comment can double the size and length of the packet. Transmit a comment only if necessary.

Text Transmit Frequency <TX RATE>
Select the frequency on which to transmit the status text when the APRS beacon is transmitted. You can select [OFF], or [1/1] ~ [1/8] (APRS only).
• 1/X means the status text will be transmitted X number of times.

QSY Function
This function imbeds the frequency of the audio channel to the first character of the status text message.

Operation when Receiving a QSY
When QSY (frequency) information is received, the station list appears (list summary and details) with the verified frequency. Press the Tuning control.

• The QSY (frequency) is set to the non data band.
• When using 6.5 kHz or 12.5 kHz step values, the display does not indicate values for 100 Hz and lower.

SETTING PACKET FILTER
Enter Menu mode and access Menu 609.

Position Limit <POSITION LIMIT>
If APRS is popular in your area, you may receive too many APRS packets for a short period. If this disturbs your APRS activities, specify a distance from your location. You will not receive APRS packets from stations beyond this distance.
Select the range from 10 to 2500 in steps of 10, plus OFF (default). The unit is mile or kilometer depending on the selection in Menu 626 (DISPLAY UNIT 1).

Packet Filter Type <TYPE>
The APRS position data is filtered.
• Check the type(s) you want to receive.
• If all types are checked, you will receive all types of data.
SELECTING YOUR STATION ICON

Enter Menu mode and access Menu 610.

Select an icon which will be displayed on the monitors of other stations as your ID. You may select an icon depending on your current location.

- The following 29 icons are selectable for APRS:
- KENWOOD/ Home/ Portable / Sailboat/ SSTV/ Aircraft/ Boat/ Car/ Motorcycle/ Jeep/ RV/ Truck/ Van/ Truck(18-wheeler)/ Digipeater/ GATEway/ WX/ Person/ Triangle/ Fire/ Eyeball/ Police/ DF station/ Mic-E Repeater/ QSO Repeater/ Big Question Mark/ IRLP/EchoLink/ Speedpost/ Wreck

APRS supports approximately 200 icons. It allows users to select each icon by specifying a combination of two ASCII codes, for example, ! and / . One is a symbol code, and the other is a table identification code (either / or \). If you select "OTHERS", use the following procedures:

1. Rotate the Tuning control to select a symbol code, then press the Tuning control.
2. Rotate the Tuning control to select a table identification code, then press the Tuning control.

Note: Because the icon code table is occasionally revised, download the latest icon code table from Mr. Bruninga's Web page (http://web.usna.navy.mil/~bruninga/aprs.html). Click on "DOWNLOAD APRS" on its home page, then download APRSnnn.zip from the FTP directory where nnn is a 3-digit number. After uncompressing the zip file, you will find a created README directory. Open and see Symbols.txt under this directory.

SETTING BEACON TX ALGORITHM

Enter Menu mode and access Menu 611.

Packet Transmit Method <METHOD>

Select the operation method for transmitting APRS packets. The table concludes how operations differ depending on the selection.

[MANUAL]: Each press of [KEY], [BCON] transmits your APRS packet.

[PTT]:
1. Press [KEY], [BCON] to switch the function ON.
   - "BCON" appears and blinks.
2. Press and hold the microphone [PTT], then speak into the microphone.
3. Release the microphone [PTT].
   - Releasing the switch transmits your APRS packet.
   - You cannot retransmit an APRS packet unless the time selected in <TX INTERVAL > passes. Wait until "BCON" starts blinking to indicate transmitting is ready.
4. To switch the function OFF, press [KEY], [BCON] again.

[AUTO]:
1. Press [KEY], [BCON] to switch the function ON.
   - "BCON" appears.
   - Switching the function ON transmits your APRS packet once. After that, APRS packets are automatically transmitted at intervals of the period selected in <TX INTERVAL >.
2. To switch the function OFF, press [KEY], [BCON] again.

TX Interval Time <TX INTERVAL>

You can change the interval for automatically transmitting APRS packets. Access <TX INTERVAL > and select 0.2, 0.5, 1, 2, 3, 5, 10, 20, or 30 minutes. The default is 3 minutes.

Note:
- With "AUTO" in <METHOD > and Beacon ON, pressing the Tuning control to complete the setting causes the APRS packet to be immediately transmitted. After that, APRS packets are transmitted at intervals of the selected period.
- While signals are present, an APRS packet is not transmitted after the interval. Approximately 2 seconds after signals drop, transmitting is executed.

Decay Algorithm <DECAY ALGORITHM>

This function continuously extends the packet transmission interval in the case that there is no change of position information.

- When the set time elapses and transmission is performed but a busy signal is present, the transceiver does not transmit. When there is no longer a busy signal, the transceiver attempts to transmit after 2 seconds.
- While transmitting by pressing the [PTT] switch, beacon transmission is reserved.
- If My station call sign is not set, My station data will not be transmitted.
- Depending on this interval, the transmission of the message will become a 1 minute interval.
- When My station position data changes, the data is transmitted using an interval time based on the set Initial Interval or Proportional Pathing. When the position data does not change, the data is transmitted based on a Decay Algorithm (1 minute, 2 minutes, 4 minutes, 8 minutes, 16 minutes, 32 minutes, 32 minutes, 32 minutes, etc.).

APRS-11
**Propotional Pathing <PROPOTIONAL PATHING>**

This function automatically changes the transmit packet path with the elapsed time.

Operation example for when **PROPOTIONAL PATHING** = **ON**

Transmission interval is 1 minute. (When the DECAY ALGORITHM = **ON**, the decay transmission interval takes precedence.)

The packet path changes with each transmission as shown below (when the packet path is set as WIDE1-1,WIDE2-2).

- **[1 minute]**: DIRECT
- **[2 minutes]**: WIDE1-1 (1 Hop)
- **[3 minutes]**: DIRECT
- **[4 minutes]**: WIDE1-1, WIDE2-1 (2 Hops)
- **[5 minutes]**: DIRECT
- **[6 minutes]**: WIDE1-1 (1 Hop)
- **[7 minutes]**: DIRECT
- **[8 minutes]**: WIDE1-1, WIDE2-2 (3 Hops)

This is repeated.

When jointly using a Decay Algorithm, if the speed is 1 knots or slower, a Decay Algorithm pattern is used for transmitting, but if the speed is 3 knots or faster, it changes to Proportional Pathing.

**PROGRAMMING A PACKET PATH**

Enter Menu mode and access Menu 612.

1. When selecting [TOTAL HOPS], you can select 1 to 7.
2. When selecting [ABBR], you can enter up to 5 characters for abbreviated state names, etc.
3. When selecting [OTHERS], enter a packet path.
4. You can enter 0 to 9, A to Z, , (comma), and –.

**Method 1 (Specific Path):**
Program the call signs of one or more digipeaters in the sequence of transfer relay; ex. “KD6ZZV,KF6RJZ”.

**Method 2 (Generic Path):**
Program RELAY and/or WIDE; ex. “RELAY,WIDE” (or simply “R,W”). In this example, your APRS packet is transferred to any RELAY digipeater near your position first, then to any WIDE digipeater. You can also program more than one WIDE. If you enter “WIDE,WIDE” for example, your APRS packet will be transferred to any WIDE near your position first, then to another WIDE.

**Method 3 (WIDEN-N Path):**
Program WIDEN-N, where N-N indicates the number of WIDE digipeaters to be used for relay. If you enter “WIDEN3-3” (or simply W3) for example, your APRS packet will be relayed by three WIDES in any direction.

**Method 4 (TRACEN-N Path):**
The operation is the same as WIDEN-N except that digipeaters add their call signs to your packet before forwarding. You may program “TRACEN3-3” (or simply T3) for example.

**Method 5 (SSID Path):**
Program a single number 1 to 15. You can easily specify the number of digipeaters that will be used for relay. You can also specify which directions of digipeaters relative to your position will be used. Refer to the following table.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Number of digipeaters</th>

<td>West</td>
</tr>
</tbody>
</table>

1. The first digipeater which receives your APRS data specifies the entire route to the destination before forwarding; often 2 digipeaters are used in total.

2. The digipeater which receives your APRS data specifies the call sign of the next digipeater before forwarding. This is repeated until your APRS data reaches the destination.
**NETWORK**
Enter Menu mode and access Menu 613.

To transmit the meteorological data, you must set the unprotocol. Using this setting, you can limit the data that is received. Use this when you are in a group. Select either “APRS(APK102)” or “ALTNET”. When selecting “ALTNET”, enter the ALTNET.

**VOICE ALERT**
Enter Menu mode and access Menu 614.

This function alerts you as to whether or not a station is active when attempting to perform voice communications with that station.

You can set Voice Alert to “OFF”, “ON”, or “RX ONLY”. When using this function, you must also set up a CTCSS frequency.

- **[ON]**: The “VA” icon appears on the display, above the frequency.
- **[RX ONLY]**: The “VAR” icon appears on the display, above the display.

**WEATHER STATION DATA OUTPUT**
Enter Menu mode and access Menu 615.

- **Transmit <TX>**
  This setting determines whether or not to transmit the meteorological data obtained from the weather observation device, with the APRS data communication.

- **Transmit Interval Time <TX INTERVAL>**
  Set the interval at which the meteorological data is transmitted with the APRS data communication. The interval can be set to 5, 10, or 30 minutes.
  - The weather observation device outputs the meteorological data at a time interval of approximately 5 minutes.
  - The following meteorological data is transmitted:
    - Rainfall
    - Air temperature
    - Wind direction
    - Wind velocity
    - Atmospheric pressure
    - Humidity
  - This data is transmitted with the APRS standard format (latitude/longitude and time information).
  - You can verify the meteorological data being output by viewing My station weather observation device icons.

**Note:**
- When the built-in data band is set to cross band, the Voice Alert function does not operate.
- Voice alert takes precedence even when TONE, CTCSS and DCS are set.
- When Voice alert is ON, TONE or CTCSS frequency scan and DCS code scan will not operate.
- When Voice alert is ON, you cannot perform TONE or CTCSS frequency selection and DCS code selection.
**SETTING AS A DIGIPEATER**

**DIGIPEAT**

Enter Menu mode and access Menu 616.

```
DIGIPEAT (MYCALL) 616
```

This transceiver with a built-in TNC may also be used as a digipeater. As described in "PACKET PATH AND DIGIPEATER", a volunteer who installs a digipeater is supposed to program it either as a RELAY or WIDE depending on various conditions.

*Note:* This transceiver is capable of setting up to 4 path segments (aliases); each path segment must have less than 10 characters. However, it is common to program either "RELAY" or "WIDE" as mentioned above.

**UICHECK**

Enter Menu mode and access Menu 617.

```
UICHECK 617
```

Does not forward the same UI packet as one received within the time specified. The unit of the parameter is 1 second.

- The counterpart of UIDIGI is valid.

**UIDIGI**

Enter Menu mode and access Menu 618.

```
UIDIGI 618
```

When receiving a UI packet which includes the parameter specified, replaces the parameter with the MYCALL parameter and forwards the packet.

1. Rotate the Tuning control to switch the function ON, then press the Tuning control.

2. Rotate the Tuning control to select “ALIASES”, then press the Tuning control.

- The display for entering a path appears; the first digit blinks.
- You can enter 0 to 9, A to Z, , (comma), and –.

**UIFLOOD**

Enter Menu mode and access Menu 619.

```
UIFLOOD 619
```

Specifies how received UI packets, which include WIDEN-N or TRACEN-N parameters, are processed. Enter WIDE or TRACE before ID, NOID, or FIRST; ex. WIDE,FIRST. With ID selected deletes the relayed digipeaters and adds the MYCALL parameter. Using NOID decrements N-N; ex. 4-3 to 4-2. Using FIRST adds the MYCALL parameter only when serving as the first digipeater.

- You can enter 0 to 9, A to Z.

**UITRACE**

Enter Menu mode and access Menu 620.

```
UITRACE 620
```

The command name must be followed by up to 5 alphanumeric characters; normally WIDE or TRACE. This causes the TNC to forward received UI packets which include WIDEN-N or TRACEN-N parameters.

- You can enter 0 to 9, A to Z.

**STORING USER PHRASES**

Enter Menu mode and access Menu 621.

```
USER PHRASES 621
```

This function (clipboard image) allows you to paste phrases into the APRS message compilation mode. You can create up to 4 phrases each of which can consist of up to 32 characters.

- The user phrase function can only be used in the message compilation mode.
- Before a message is copied, the number of letters cannot be guaranteed. Only the number of letters available will be copied, the remainder will be truncated.
- To copy a message, enter message compilation mode, press [F] to enter function mode, then press [PASTE1], [PASTE2], [PASTE3], or [PASTE4] to copy the message that has been set up for each key.
- If the user messages [PASTE1], [PASTE2], [PASTE3], and [PASTE4], are not set up, they cannot be used.
STORING AUTO MESSAGE REPLY
Enter Menu mode and access Menu 622.

- **Auto Answer Reply <REPLY>**
  While you are driving, for example, you cannot immediately answer to received messages. On this transceiver, you can program the message to be automatically returned when a message is received.

  1. Rotate the **Tuning** control to select “ON”, then press the **Tuning** control.
  2. Rotate the **Tuning** control to select “TEXT”, then press the **Tuning** control.
     - The display for entering a message appears; the first digit blinks.

- **Reply To Call Sign <REPLY TO>**
  When there is a message you would like to reply to for the specific call sign, preset that call sign for automatic responses.

PROGRAMMING A MESSAGE GROUP CODE
Enter Menu mode and access Menu 623.

- **Group Filtering**
  Use a message group code to exchange messages only among your group members. With one or more message group codes programmed, you will receive messages that include the same group code(s), besides messages addressed to you. If you program one or more bulletin group codes, you will not receive bulletins addressed to other specific groups. You can program any desired code using alphanumeric characters; up to 9 characters for messages, and up to 4 characters for bulletins. You can also program up to 6 codes at the same time; each code must be separated by a comma (,). If you program 3 message group codes, for example, you will receive all messages that include one of the 3 codes. If you program 3 bulletin group codes, you will reject bulletins addressed to specific groups which do not use any of the 3 codes.

- **Setting Sound**
  Enter Menu mode and access Menu 624.

  - **RX Beep Type <RX BEEP>**
    This transceiver beeps each time it receives any type of APRS packets for further description, refer to “RECEIVING APRS DATA”.

    | Selection     | Operation                  |
    |---------------|----------------------------|
    | OFF           | The APRS/NAVITRA beep tone does not sound. |
    | MESSAGE ONLY  | Beep sounds only when a message is received at your station address. |
    | MINE          | Beep sounds when a message is received at your station address and your transmitted data is received by a digipeater. |
    | ALL NEW       | Beep sounds when a message is received at your station address and new packet data is received. |
    | ALL           | Beep sounds when a message is received at your station address and duplicate data or invalid data is received. |

- **Special Call Sound <SPECIAL CALL>**
  This function emits a special call sound when data is received at My station address. Set the call sign of the stations from which you want to receive special call notifications.

- **APRS Voice Announce <APRS VOICE>**
  When using an optional VGS-1 unit, you may select ON. Each time you receive a message addressed to you, the transceiver announces the call sign of the sender. If the initial character of the message is %, the transceiver announces the subsequent characters one by one.
SETTING INTERRUPT DISPLAY
Enter Menu mode and access Menu 625.

- **Display Area <DISPLAY AREA>**
  Selects the Display area.
  - [ENTIRE]:
    - **N6DJY-3**
    - **TN-0710**
    - **I will leave home soon.**
    - **[ENTIRE]**
    - **[HALF]**
    - **440.000**
    - **[HALF]**

- **Automatic Brightness <AUTO BRIGHTNESS>**
  When ON is selected and My station address message is received, the backlight turns on.

- **Change Color <CHANGE COLOR>**
  When ON is selected and My station address message is received, the backlight color changes.

SELECTING A DISPLAY UNIT (1)
Enter Menu mode and access Menu 626.

- **Speed, Distance <SPEED, DISTANCE>**
  Select to [mi/h, mile], [km/h, km], or [knots, nm].

- **Altitude, Rainfall <ALTITUDE, RAIN>**
  Select to [feet/inch] or [m/mm].

- **Temperature <TEMPERATURE>**
  Select to [°F] or [°C].

SELECTING A DISPLAY UNIT (2)
Enter Menu mode and access Menu 627.

- **Latitude longitude <POSITION>**
  Select to [dd°mm. mm'], or [dd°mm' ss. s'].

- **Grid Format <GRID FORMAT>**
  Select to [MAIDENHEAD GRID], [SAR GRID (CONV)], or [SAR GRID (CELL)].

SELECTING A NAVITRA GROUP
Enter Menu mode and access Menu 628.

- **Group Mode <GROUP MODE>**
  Select to Group mode ON or OFF.

- **Enter Group Code <GROUP CODE>**
  - You can enter 0 to 9, A to Z.

STORING NAVITRA MESSAGE
Enter Menu mode and access Menu 629.

You can create up to 5 phrases each of which can consist of up to 20 characters.
**PACKET MONITOR DISPLAY**

This transceiver presents Terminal Window mode to display raw data of received APRS packets. It displays up to 155 characters per page and holds up to 10 pages.

1. Press **[KEY], [P.MON]**.

   - To enter Terminal Window mode.

2. To access old pages, press **[HOLD]**.

   - Rotate the Tuning control or press **[1] or [↓]** to change the page.
   - Press **[RESUME]** to quit the Hold function.
   - While using the Hold function, newly received packets will not be stored in buffer.
   - When pressed **[ALLCLR]**, packet monitor display is cleared.

**DX PACKETCLUSTERS MONITOR**

DX PacketClusters are networks which consist of nodes and stations who are interested in DXing and contesting. If one station finds a DX station on the air, he (or she) sends a notice to his (or her) node. Then this node passes the information to all its local stations besides another node. This transceiver can display received DX information and hold the latest information on up to 10 DX stations. Use this function to monitor the latest DX information in your local area. You cannot send DX information to a node, using the function.

1. Access Menu 601 (INTERNAL TNC - DATA BAND) to select band A or B.

   - If the common transfer rate in your local PacketCluster network is 9600 bps, access Menu 601 (INTERNAL TNC - PACKET SPEED) and select “9600 bps”.

2. Tune to the frequency of the target PacketCluster node.

3. Press **[TNC]** to enter APRS mode.

   - “APRS” should appear.

4. Press **[F], [DX]**.

   - Each time new DX cluster data is received, a call sign, frequency, and time are displayed.
   - Information of up to 5 DX stations are displayed at the same time.
   - When a duplicate DX cluster data is received, “dD” and a call sign are displayed.

**Connecting TM-D710 with the HF Transceiver**

In order to connect TM-D710 to the HF transceiver, you need to prepare three cables by yourself. For the connection between the PC/COM connectors on the two transceivers, you may use a commercially available RS-232-C cross-wired cable.

- A D-SUB female/male conversion adapter is required.
<table>
<thead>
<tr>
<th>Problem</th>
<th>Probable Cause</th>
<th>Corrective Action</th>
</tr>
</thead>
</table>
| Packet operation results in no connects with other stations. | 1 The squelch is open.  
2 You did not correctly set the data length and parity bit. | 1 Select the correct squelch level so that the squelch is opened only when signals are present.  
2 Use HBAUD command to select the appropriate transfer rate. |
| You did not receive any DX cluster data. | You did not select the APRS mode. | Press [TNC] to enter APRS mode; “APRS” should appear. |
| You cannot transmit any APRS data. | 1 Beacon is OFF.  
2 The squelch is open.  
3 The data band is inactive.  
4 You did not select APRS mode.  
5 You selected Packet mode.  
6 You did not correctly program your call sign. | 1 Press [KEY], [BCON] to switch Beacon ON.  
2 Select the correct squelch level so that the squelch is opened only when signals are present.  
3 If you have blanked the data band, press the appropriate [BAND SEL] (1 s) to active it.  
4 Press [TNC] to enter APRS mode; “APRS” should appear.  
5 Press [TNC], then [TNC] again; “APRS” should appear.  
6 Use Menu 600 (BASIC SETTING – CALLSIGN) to correctly program your call sign. |
| You did not receive any APRS packet. | 1 You did not correctly set the data length and parity bit.  
2 You did not select the appropriate packet transfer rate. | 1 Select Packet mode, send the following commands to the TNC, then select APRS mode: AW 8 [ENTER], PAR 0 [ENTER], then RESTART [ENTER].  
2 Use Menu 601 (INTERNAL TNC – DATA SPEED) to select the appropriate packet transfer rate (generally 1200 bps). |
| When using a GPS receiver with “AUTO” selected in Menu 611 (BEACON TX ALGORITHM - METHOD), you did not transmit any position data. | The GPS receiver did not yet start correct measurement. | With “AUTO” selected, the transceiver must first receive any NMEA data in order to transmit your position data. |
| You cannot activate Visual Scan, Remote Control (K type), nor Repeater (K type). | You selected APRS or Packet mode. | Press, [TNC] repeatedly so neither “APRS” nor “PACKET” is visible. |
There are 4 types of transceiver reset available:

**VFO Reset**
Use to initialize the VFO and accompanying settings.

**PARTIAL (Partial) Reset**
Use to initialize all settings other than the Memory channels, the DTMF memory, and the PM channels.

**PM Reset**
Use to reset only the Programmable Memory channels to their default values.

**FULL Reset**
Use to initialize all transceiver settings that you have customized. (Date and time are not reset.)

There are 2 ways to perform a reset on the transceiver: by key operation and by accessing Menu mode.

### KEY OPERATION

1. Turn the transceiver power OFF.
3. Rotate the **Tuning** control and select your desired reset type: **VFO RESET**, **PARTIAL RESET**, **PM RESET**, or **FULL RESET**.
4. Press the **Tuning** control to set the reset type.
   - A confirmation message appears on the display.
   - Press [BACK] to return to the previous display or [ESC] to cancel the reset.
5. Press the **Tuning** control again to perform the reset.

**Note:** When in Remote Control or Repeater mode, you cannot reset the transceiver using the Key Operation method.

### MENU MODE

1. Enter Menu mode and access Menu 999.
2. Set the reset type to **VFO RESET**, **PARTIAL RESET**, **PM RESET**, or **FULL RESET**.
3. Press the **Tuning** control to set the reset type.
   - A confirmation message appears on the display.
   - Press [BACK] to return to the previous display or [ESC] to cancel the reset.
4. Press the **Tuning** control again to perform the reset.

**Note:** When the Channel Display function or Key Lock function is ON, the transceiverreset cannot be performed.
VGS-1 (OPTIONAL) OPERATION

When using the optional VGS-1 voice guide & storage unit, you gain access to the voice recorder and voice announcement functions. <The VGS-1 is sold depending upon area.>

VOICE ANNOUNCEMENTS

When changing modes, frequencies, settings, etc., an audio voice will announce the new information.

1. Enter Menu mode and access Menu 003.

   ![Audio Announcement](image)

2. Set the announcement function to MANUAL, AUTO, or OFF.
   - Refer to the tables below for announcements based on settings.

### MANUAL:
A microphone PF key must be programmed as [VOICE] to use MANUAL voice announcement.

<table>

**Voice Announcement Language**

1. Enter Menu mode and access Menu 004.
   ![Menu 004](image)
   ```plaintext
   AUDIO ANNOUNCE LANGUAGE
   ▶ ENGLISH
   ESC BACK
   ```

2. Set the language to ENGLISH or JAPANESE.

**Voice Announcement Volume**

1. Enter Menu mode and access Menu 005.
   ![Menu 005](image)
   ```plaintext
   AUDIO ANNOUNCE VOLUME
   ▶ LEVEL 5
   ESC BACK
   ```

2. Set the announcement volume level from 1 to 7.
   * To turn the volume OFF, turn the announcement function OFF.

**Voice Announcement Speed**

1. Enter Menu mode and access Menu 006.
   ![Menu 006](image)
   ```plaintext
   AUDIO ANNOUNCE SPEED
   ▶ SPEED 1
   ESC BACK
   ```

2. Set the announcement speed level from 0 to 4.
   * The speed settings are as follows:
     0: 0.85 times normal speed
     1: Normal speed
     2: 1.15 times normal speed
     3: 1.30 times normal speed
     4: 1.45 times normal speed

**VOICE RECORDER**

The voice recorder provides you with 3 VGS channels for recording voice memos, along with a single VGS channel for recording conversations. You can also prepare automated message responses to received calls.

Each recording can last for up to 30 seconds.

**Voice Memos**

To record a voice memo, for later playback:

1. Press the PF key programmed as [VGS].
   ![PF key programmed as VGS](image)

2. Press and hold the key for the VGS channel number you want to store the memo in: [1], [2], or [3].
   * A beep will sound and the transceiver will enter Recording mode.

3. Press and hold the VGS channel number key again (the same key you pressed in the previous step), then speak into the microphone to record your memo.
   * Recording begins as soon as you press the VGS channel number key, and a timer appears on the display.
   * Pressing the microphone PTT switch at this time will transmit your message as well as record it. Do not press the microphone PTT switch if you do not want to transmit your message.

4. Release the VGS channel number key to end the recording at any time and store it into the selected VGS channel.
   * If the memory becomes full, recording will stop automatically and store the voice memo to memory.
   * “WRITING” appears on the display while the recording is being stored to memory.
   * To exit, press [VGS] again.
Continuous Recording

Received signals on the control band are continuously recorded, with the memory retaining the last 30 seconds of recorded signals.

1. Enter Menu mode and access Menu 009.

2. Set the Continuous Recording to ON (or OFF).
   - The icon appears on the display when this function is activated. The icon does not appear during playback, in Repeater mode, or in Remote Control mode.

3. Press the PF key programmed as [VGS].

Playback Repeat

You can set messages to be repeatedly played back.

1. Enter Menu mode and access Menu 007.

2. Set the Playback Repeat function to ON or OFF.

Playback Repeat Interval

If the Playback Repeat function is activated, you can set a time interval for how often the memo/message is played back.

1. Enter Menu mode and access Menu 008.

2. Set the interval from 0 to 60 seconds.

Playback

1. Press the PF key programmed as [VGS].

   • When preparing to transmit, press the [PTT] switch before pressing the channel number (1 - 3) key.

2. Press the key for the VGS channel number you want to play back: [1], [2], [3], or [4] (when the Continuous Recording is ON).
   - The recording saved in the channel you selected is played back.

   • To end playback at any time, press [CLR].
   • To exit, press [VGS] again.
   • During playback, you can switch to any of recordings 1, 2, 3, or 4 by pressing the appropriate key.
This transceiver is capable of receiving signals on one band and retransmitting signals on the other band. This function repeats signals originating from one band, using the other band. For example, a signal received on band A (VHF) is retransmitted on band B (UHF). Similarly, a signal received on band B (UHF) is retransmitted on band A (VHF).

**Locked-band Repeater:** The transceiver uses the same band to receive or transmit a signal. You can set either the A band (A-TX) or B band (B-TX) as the transmit band.

**Cross-band Repeater:** If receiving a signal on the TX band, the transceiver switches the current RX only band to the TX band. This is useful when joining in a group talk. Participants in a group talk need to set a receive and transmit frequency on different bands so as not to miss any conversation within the group.

### REPEATER OPERATION MODE

1. Enter Menu mode and access Menu 403.

2. Set the Repeater operation mode to CROSS BAND, LOCKED TX:A-BAND, or LOCKED TX:B-BAND.

3. Turn the transceiver power OFF.

4. Press [TONE] + Power ON.
   - The Repeater mode is ON and the LOCK and LOCK icons blink on the display.
   - You are unable to perform any transceiver functions while in Repeater mode.
   - To return to normal operation, turn the transceiver power OFF, then press [TONE] + Power ON.

**Note:**
- You cannot activate the Repeater function while in single band operating mode or Weather Channel mode.
- Activating the Repeater function switches OFF the Automatic Simplex Checker (ASC).
- The Time-Out Timer is locked at 3 minutes.
- Resetting the transceiver will not cancel the Repeater mode.

### REPEATER TX HOLD

If necessary, you can set the transceiver to remain in the transmit mode for 500 ms after a signal drops.

1. Enter Menu mode and access Menu 404.

2. Set the Repeater Hold function to ON or OFF.

### REPEATER ID TX

If necessary, you can set the transceiver to transmit your call sign every 10 minutes.

1. Enter Menu mode and access Menu 406.

2. Set the ID Transmit function to OFF, MORSE, or VOICE.
   - To use VOICE transmission, you must have the VGS-1 option installed. When using the VGS-1 option, the ID Transmit function will use VGS channel 3 as the call sign.
   - When selecting MORSE, the call sign stored in Menu 405 (see below) will be transmitted at 20 wpm (words per minute).

### Entering your Repeater ID

1. Enter Menu mode and access Menu 405.

2. Enter your call sign.
If you also have a compatible Kenwood handy transceiver, you may use it as a remote control for this mobile transceiver. You will control one band on the mobile while sending DTMF tones to the other band from the handheld. This function is useful, for example, when you want to control the mobile from a location outside your vehicle.

Note:

- As a remote control, you can also use a handy transceiver which does not have a remote control function but a DTMF function. However, you must manually send DTMF tones for control code strings. Skip steps 1 and 3 in "PREPARATION".
- The FCC rules permit you to send control codes only on the 440 MHz band.

PREPARATION

Let us assume band A (VHF) of the mobile transceiver will be controlled.

On the handy transceiver:

1. Program a 3-digit secret number.
   • For the programming method, see the instruction manual for the handheld.

2. Select the transmit frequency on the UHF band.

3. Make the handheld enter Remote Control mode.
   • For the method, see the instruction manual for the handheld. If not described, consult your dealer.

On the mobile transceiver:

4. Enter Menu mode and access Menu 522.

5. Set the ID code to the same secret number you set on the handy transceiver.

6. Select the receive frequency on band B (UHF).
   • Match this frequency with the transmit frequency on the handheld.

7. Select band A (VHF) as the TX band or Control band.

8. To cause the mobile to send a control acknowledgment to the handheld, enter Menu 523 and set it to ON.
   • DTMF tones which represent the secret number will be used as an acknowledgment.

9. Turn the transceiver power OFF.

   • The \( \text{CTRL} \) and \( \text{BACK} \) icons appear on the display.
   • To exit Remote Control operation, turn the transceiver power OFF, then press [REV] + Power ON again.

CONTROL OPERATION

While in Remote Control mode, the DTMF keys of the handheld will function as shown in the table below. Each time you press the desired key, the handheld will automatically enter transmit mode and send the corresponding command to the mobile.

Note: If using a handheld without a remote control function, manually send “A###Y#” where “###” is a 3-digit secret number and “Y” is a single-digit control command. If you do not add “A#” to the end, you can skip sending “A###” next time; however, the mobile may be accidentally controlled by other stations.

WEATHER ALERT (K TYPE MODELS ONLY)

The Weather Alert is available only in the USA and Canada. When activated, this function will check for a received NOAA 1050 Hz tone. When the tone is received, the weather alert tone will sound.

WEATHER ALERT ON/ OFF

1. Enter Menu mode and access Menu 110.

2. Set the Weather Alert to ON or OFF.
   - When activated, the \(\text{WX}\) icon appears on the display.
   - When a signal is being received, the \(\text{WX}\) icon blinks.

Weather Channel

Whether or not the Weather Alert is activated, you can still access the weather channels. The Weather Alert simply notifies you of activity on the weather channels.

1. Press the key programmed with the \(\text{WX}\) function.

2. Rotate the \textbf{Tuning} control to select your desired channel.

</table>
The Sky Command II allows remote control of a TS-2000, TS-2000X, TS-B2000, TS-480HX, TS-480SAT, TS-570D, TS-570S, or TS-870S HF transceiver. You will use one transceiver as a control station called “Commander”. The transceiver connected with the HF transceiver is called “Transporter”. It will function as an interface between the Commander and the HF transceiver. This system allows you, for example, to watch for and hunt DX while washing your car, or to operate the HF transceiver while relaxing in your car, living room, or patio, instead of in your shack.

The Commander and Transporter transfer audio and commands as below:

CONNECTING THE TRANSPORTER WITH THE HF TRANSCEIVER

In order to connect the transporter to the HF transceiver, you need to prepare three cables by yourself. For the connection between the PC/COM connectors on the two transceivers, you may use a commercially available RS-232-C cross-wired cable (A D-SUB female/male conversion adapter is required.)

**Note:**
- Switch OFF both the Transporter and HF transceiver before making the connection.
- The Transporter automatically transmits its call sign in Morse at regular intervals because of legal requirements; therefore, transmit side tone must be output from the HF transceiver.
- When the Transporter is too close to the HF transceiver, unwanted feedback may cause malfunction.
- Do not share a regulated power supply between the Transporter and the HF transceiver. Unwanted feedback may cause malfunction.
**PREPARATION FLOW**

The following steps should guide you to a good start of Sky Command operation. First connect the Transporter to the HF transceiver.

1. **<On the Commander and Transporter>** Select the same VHF and UHF frequencies.

2. **<On the Commander>** Access Menu 700 to program a call sign (9 digits max.) for the Commander.
   - You may enter your exact call sign; ex. W6DJY.

3. **<On the Commander>** Access Menu 701 to program a call sign (9 digits max.) for the Transporter.
   - This call sign must be different from the one for the Commander. So you may add SSID characters; ex. W6DJY-1.

4. **<On the Transporter>** Access Menu 700 to program the same call sign as you entered in step 2.

5. **<On the Transporter>** Access Menu 701 to program the same call sign as you entered in step 3.

6. **<On the Commander and Transporter>** Access Menu 702 and select the tone frequency.
   - Select the same tone frequency on both transceivers.

7. **<On the Commander>** Access Menu 703 and select “COMMANDER”.
   - “Push [ 0 ] key to start Commander!!” appears.

8. **<On the Transporter>** Access Menu 703 and select “TRANSPORTER”.

Now the Commander and Transporter are in Sky Command mode. For operations in this mode, see “CONTROL OPERATION”. First switch ON the HF transceiver and press [SYNC] on the Commander. To exit the Sky Command mode, access Menu 703 and select “OFF”.

**Note:**
- Unless you program call signs, you cannot select “COMMANDER” or “TRANSPORTER” using Menu 703.
- On the HF transceiver, select 9600 bps and 1 stop bit (default) using the Menu Set-up function.
- Adjust the audio level on both the Transporter and HF transceiver while listening to audio output from the Commander. An appropriate position of the AF control on the HF transceiver might be in the range, 8:30 to 9:00.
- To distinguish your various stations or nodes, you can have up to 15 Secondary Station IDentifiers (SSIDs); ex. W6DJY-1 to W6DJY-15. You always have to put a dash between your call sign and SSID number.

**PROGRAMMING CALL SIGNS**

The built-in TNCs of the Commander and Transporter communicate each other when you send a control command from the Commander. So you must program different call signs (9 digits max.) on these transceivers as the IDs of the TNCs.

Use the following Menu Nos. to program call signs:

<table>
<thead>
<tr>
<th>On Commander</th>
<th>On Transporter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Menu 700</td>
<td>Menu 700</td>
</tr>
<tr>
<td>Commander Call Sign</td>
<td>Commander Call Sign</td>
</tr>
<tr>
<td>Menu 701</td>
<td>Menu 701</td>
</tr>
<tr>
<td>Transporter Call Sign</td>
<td>Transporter Call Sign</td>
</tr>
</tbody>
</table>

1. Access Menu 700 or 701, then press the Tuning control.
   - The callsign entry field appears; the first digit blinks.

2. Rotate the Tuning control to select a character.
   - You can enter 0 to 9, A to Z, and –.

3. Press [–].
   - The cursor moves to the next digit.

4. Repeat steps 2 and 3 to enter up to 9 digits.
   - [BACK]: Cancels entry of a call sign.
   - [<–]: Causes the cursor to move backward.
   - [INS]: Inserts the currently selected character.
   - [CLR]: Deletes the digit at which the cursor is blinking.

5. Press the Tuning control to complete the setting.

The keypad on the Microphone also is available to enter alphanumeric characters in step 2.
PROGRAMMING A TONE FREQUENCY

On receiving a tone from the Commander, the Transporter causes the HF transceiver to enter Transmit mode. On both the Commander and Transporter, access Menu 702 and select the desired, same tone frequency.

CONTROL OPERATION

When in the Sky Command mode, the Microphone keys of the Commander will function as below. First switch ON the HF transceiver and press Microphone [0] on the Commander.

Each time you press the desired key, the Commander will automatically enter transmit mode and send the corresponding control command to the Transporter.

<table>
<thead>
<tr>

</tr>
<tr>
<td>[#] (ENTER)</td>
<td>In VFO mode: frequency entry ON In Memory Recall mode: channel number entry ON</td>
</tr>
<tr>
<td>[PTT]</td>
<td>To transmit audio on an HF frequency</td>
</tr>
</tbody>
</table>

Note: To change the frequency or memory channel on the HF transceiver, rotate the Tuning control.

"FS" appears when you select 1 kHz step (LSB/ USB/ CW) or 10 kHz step (FM/ AM).

After pressing Mic [#], press Mic [0] to [9] to enter a frequency or memory channel number.
