

For each of the above configurations for both $\omega=0$ and $\omega=\propto$, determine whether or not the resulting circuit appears as either a resistive circuit, a short circuit, or an open circuit. Check the appropriate blank(s).

For $\omega=0$

## Complex Impedance Quiz

Devise formulas for each of the complex impedance configurations using $R, X_{C}$, and $X_{L}$.
Hint: Impedances in series add, i.e., $\mathrm{Z}=\mathrm{Z}_{1}+\mathrm{Z}_{2}$
Two impedances in parallel equal the "product over the sum", i.e. $Z=\frac{Z_{1} Z_{2}}{Z_{1}+Z_{2}}$
A.

E.

C.

## Passive Filter Quick Recognition Quiz

For each of the four schematics, indicate whether or not the configuration represents a Low Pass Filter or a High Pass Filter.

Hint: $\quad$ Consider the reactance when $\omega=0$.

$$
\begin{array}{lll}
\mathrm{X}_{\mathrm{L}}=0 & \mathrm{~V}_{\mathrm{L}}=0 & \mathrm{~V}_{\mathrm{R}}=\mathrm{V}_{\text {in }} \\
\mathrm{X}_{\mathrm{C}} \gg 0 & \mathrm{~V}_{\mathrm{C}}=\mathrm{V}_{\text {in }} & \mathrm{V}_{\mathrm{R}}=0
\end{array}
$$

If $V_{\text {out }}=V_{\text {in }}$, then since $\omega=0$, passes low frequencies, hence Low Pass Filter.
If $\mathrm{V}_{\text {out }}=0$, then since $\omega=0$, blocks low frequencies, hence passes only high frequencies, i.e., High Pass Filter.

Similarly: $\quad$ Consider the reactance when $\omega \gg 0$.

$$
\begin{array}{lll}
\mathrm{X}_{\mathrm{L}} \gg 0 & \mathrm{~V}_{\mathrm{L}}=\mathrm{V}_{\text {in }} & \mathrm{V}_{\mathrm{R}}=0 \\
\mathrm{X}_{\mathrm{C}}=0 & \mathrm{~V}_{\mathrm{C}}=0 & \mathrm{~V}_{\mathrm{R}}=\mathrm{V}_{\text {in }}
\end{array}
$$

If $V_{\text {out }}=V_{\text {in }}$, then since $\omega \gg 0$, passes high frequencies, hence High Pass Filter.
If $V_{\text {out }}=0$, then since $\omega \gg 0$, blocks high frequencies, hence passes only low frequencies, i.e., Low Pass Filter.
