

Power and Voltage Ratios Expressed in Decibels (dB's)

$$1 \text{ Bel} = \log(\text{Power}_2 / \text{Power}_1)$$

$$1 \text{ decibel} = 1 \text{ dB} = 0.1 \text{ Bel, hence } 10 \text{ dB} = 1 \text{ Bel}$$

To express a Power Ratio in dB's, use $\text{dB} = 10 \log(\text{Power}_2 / \text{Power}_1)$

$$\text{Let } \text{Power}_2 = 2 \text{ Power}_1$$

$$\text{Power Ratio in dB's} = 10 \log(2 \text{ Power}_1 / \text{Power}_1) = 10 \log(2) = +3.01$$

$$\text{Let } \text{Power}_2 = 0.5 \text{ Power}_1$$

$$\text{Power Ratio in dB's} = 10 \log(0.5 \text{ Power}_1 / \text{Power}_1) = 10 \log(0.5) = -3.01$$

-3 dB is often expressed as "3 dB Down" which is the half power point ($\text{Power}_2 = 1/2 \text{ Power}_1$)

$$\text{Let } \text{Power}_2 = \text{Power}_1$$

$$\text{Power Ratio in dB's} = 10 \log(\text{Power}_1 / \text{Power}_1) = 10 \log(1) = 0$$

dB = 0 does not imply zero power but rather a power ratio of one-to-one

dB = 0 can be used as a zero reference; that is to say, set your reference level to a particular value and then use the dB scale to refer all other values to that reference level.

Examples: Reference Level = 400 watts.

$$200 \text{ watts} = -3 \text{ dB}$$

$$800 \text{ watts} = +3 \text{ dB}$$

$$400 \text{ watts} = 0 \text{ dB}$$

$$4000 \text{ watts} = +10 \text{ dB}$$

$$40 \text{ watts} = -10 \text{ dB}$$

$$650 \text{ watts} = +2.1 \text{ dB}$$

$$65 \text{ watts} = -7.9 \text{ dB}$$

$$100 \text{ watts} = -6 \text{ dB}$$

$$2,500,000 \text{ watts} = +38 \text{ dB}$$

Note: A reference of 1 milliwatts is used for dBm's

$$1 \text{ milliwatts} = 10 \log(1 / 1) = 0 \text{ dBm}$$

$$5 \text{ milliwatts} = 10 \log(5 / 1) = +7 \text{ dBm}$$

$$500 \text{ milliwatts} = +27 \text{ dBm}$$

$$0.001 \text{ milliwatts} = -30 \text{ dBm}$$

For Voltage, $\text{Power} = IE = (E/R)E = E^2/R$

To express a Voltage Ratio in dB's, use $\text{dB} = 10 \log(\text{Power}_2 / \text{Power}_1) = 10 \log[(E_2^2/R) / (E_1^2/R)]$
 $10 \log[(E_2^2/R) / (E_1^2/R)] = 10 \log(E_2^2 / E_1^2) = 20 \log(E_2 / E_1)$

$$\text{For Power Ratio dB} = +3, \quad 20 \log(E_2 / E_1) = +3$$

$$\text{For Power Ratio dB} = -3, \quad 20 \log(E_2 / E_1) = -3$$

$$\text{For Power Ratio dB} = 0, \quad 20 \log(E_2 / E_1) = -0.15 \text{ and } E_2 / E_1 = 0.707 = \text{SQRT}(2) / 2$$

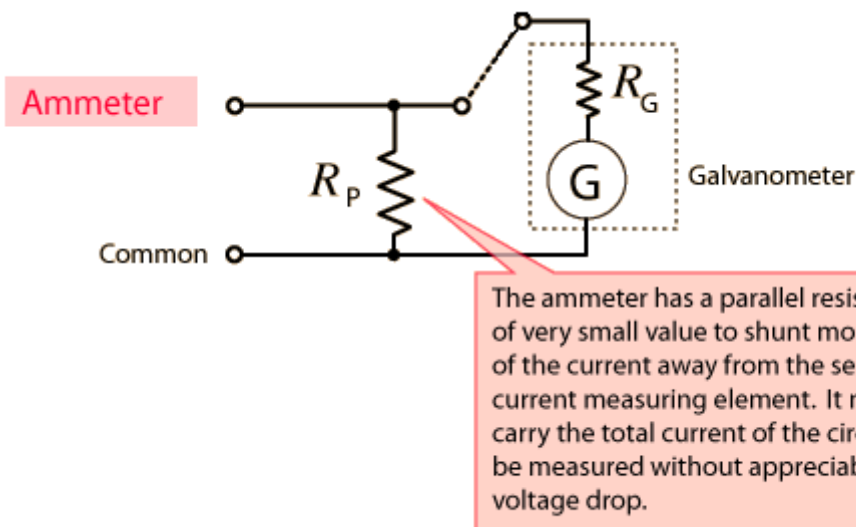

Galvanometer Based Multimeter Voltmeter, Ammeter, Ohmmeter

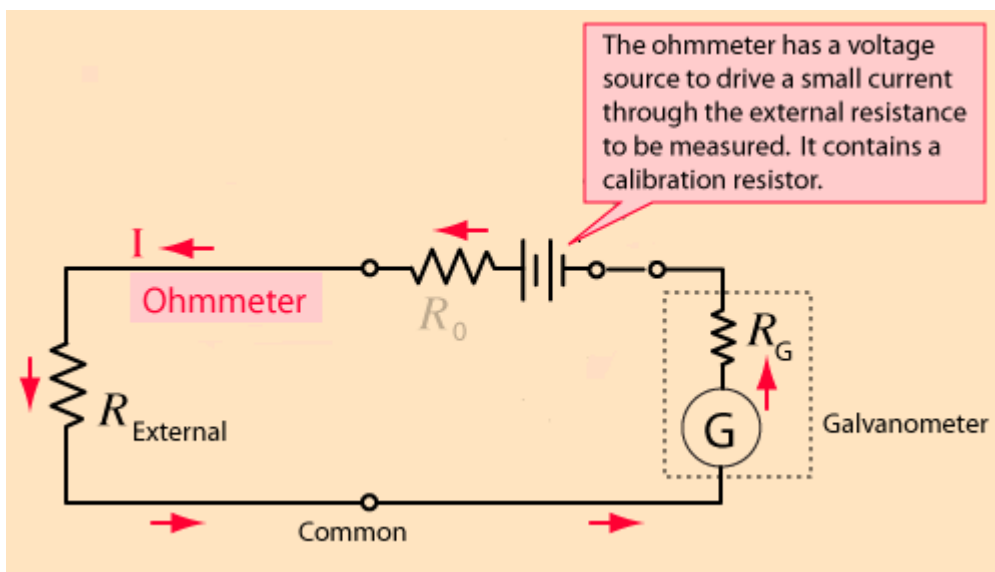

<http://hyperphysics.phy-astr.gsu.edu/hbase/magnetic/galvan.html>

A voltmeter is connected in parallel with the circuit element (R_L) to measure voltage.

A ammeter is always connected in series with the circuit element (R_L) to measure current.

The circuit element (R_L) must be disconnect from the circuit in order to measure resistance with an ohmmeter.

In lieu of an *ohmmeter*,

an *ammeter* is placed in series with the circuit element of interest R_L and the current is noted;

and a *voltmeter* is connected in parallel with the circuit element R_L and the voltage is noted.

The Resistance R_L equal to $R_L = \frac{V}{I}$
